*/
// NO WARRANTY!  This class is in the public domain.
/**
* Default base class for SAX2 event handlers.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class is available as a convenience base class for SAX2
* applications: it provides default implementations for all of the
* callbacks in the four core SAX2 handler classes:</p>
*
* <ul>
* <li>{@link org.xml.sax.EntityResolver EntityResolver}</li>
* <li>{@link org.xml.sax.DTDHandler DTDHandler}</li>
* <li>{@link org.xml.sax.ContentHandler
 ContentHandler}</li>
* <li>{@link org.xml.sax.ErrorHandler ErrorHandler}</li>
* </ul>
*
* <p>Application writers can extend this class when they need to
* implement only part of an interface; parser writers can
* instantiate this class to provide default handlers when the
* application has not supplied its own.</p>
*
* <p>This class replaces the deprecated SAX1
* {@link org.xml.sax.HandlerBase HandlerBase} class.</p>
*
* @since SAX 2.0
* @author David Megginson,
* @see org.xml.sax.EntityResolver
* @see org.xml.sax.DTDHandler
* @see org.xml.sax.ContentHandler
```

```
* @see org.xml.sax.ErrorHandler
*/

/**

```
    * Returns the most specific, visible, heavyweight Component
    * under the cursor. This method should return null iff the cursor is
    * not over any Java Window.
    *
    * @param   useCache If true, the implementation is free to use caching
    * mechanisms because the Z-order, visibility, and enabled state of the
    * Components has not changed. If false, the implementation should not
    * make these assumptions.
    */
/**
    * Updates the global cursor. We apply a three-step scheme to cursor
    * updates:<p>
    *
    * (1) InputEvent updates which are outdated are discarded by
    * <code>updateCursorImmediately(InputEvent)</code>.<p>
    *
    * (2) If 'useCache' is true,
 the native code is free to use a cached
    * value to determine the most specific, visible, enabled heavyweight
    * because this update is occurring in response to a mouse move. If
    * 'useCache' is false, the native code must perform a new search given
    * the current mouse coordinates.
    *
    * (3) Once we have determined the most specific, visible, enabled
    * heavyweight, we use findComponentAt to find the most specific, visible,
    * enabled Component.
    */

/**
    * Returns an array containing all of the elements in this list
    * in proper sequence (from first to last element).
    *

```
    * <p>The returned array will be "safe" in that no references to it are
    * maintained by this list.  (In other words, this method must allocate
    * a new array).  The caller is thus free to modify the returned array.
    *
    * <p>This method acts as bridge between array-based and collection-based
    * APIs.
    *
    * @return an array containing all of the elements in this list
    *         in proper sequence
    */

*/
/**
* This class represents access to a network via sockets.
* A SocketPermission consists of a
* host specification and a set of "actions" specifying ways to
* connect to that host. The host is specified as
* <pre>
*    host = (hostname | IPv4address | iPv6reference) [:portrange]
*    portrange = portnumber | -portnumber | portnumber-[portnumber]
* </pre>
* The host is expressed as a DNS name, as a numerical IP address,
* or as "localhost" (for the local machine).
* The wildcard "*" may be included once in a DNS name host
* specification. If it is included, it must be in the leftmost
* position, as in "*.sun.com".
* <p>
* The format of the IPv6reference should follow that specified in <a
* href="http://www.ietf.org/rfc/rfc2732.txt"><i>RFC 2732:
 Format
* for Literal IPv6 Addresses in URLs</i></a>:
* <pre>
*    ipv6reference = "[" IPv6address "]"
*</pre>
* For example, you can construct a SocketPermission instance
* as the following:
* <pre>
*    String hostAddress = inetaddress.getHostAddress();
*    if (inetaddress instanceof Inet6Address) {
*        sp = new SocketPermission("[" + hostAddress + "]:" + port, action);
*    } else {
*        sp = new SocketPermission(hostAddress + ":" + port, action);
*    }
* </pre>
* or
* <pre>
*    String host = url.getHost();
*    sp = new SocketPermission(host + ":" + port, action);
* </pre>
* <p>
```

```
* The <A HREF="Inet6Address.html#lform">full uncompressed form</A> of
* an IPv6 literal address is also valid.
* <p>
* The port or portrange is optional. A port specification of the
* form "N-", where <i>N</i> is a port number, signifies all ports
* numbered <i>N</i> and above, while a specification of the
* form
 "-N" indicates all ports numbered <i>N</i> and below.
* The special port value {@code 0} refers to the entire <i>ephemeral</i>
* port range. This is a fixed range of ports a system may use to
* allocate dynamic ports from. The actual range may be system dependent.
* <p>
* The possible ways to connect to the host are
* <pre>
* accept
* connect
* listen
* resolve
* </pre>
* The "listen" action is only meaningful when used with "localhost" and
* means the ability to bind to a specified port.
* The "resolve" action is implied when any of the other actions are present.
* The action "resolve" refers to host/ip name service lookups.
* <P>
* The actions string is converted to lowercase before processing.
* <p>As an example of the creation and meaning of SocketPermissions,
* note that if the following permission:
*
* <pre>
*   p1 = new SocketPermission("puffin.eng.sun.com:7777", "connect,accept");
* </pre>
*
* is granted to some code, it allows that code to connect to
 port 7777 on
* {@code puffin.eng.sun.com}, and to accept connections on that port.
*
* <p>Similarly, if the following permission:
*
* <pre>
*   p2 = new SocketPermission("localhost:1024-", "accept,connect,listen");
* </pre>
*
* is granted to some code, it allows that code to
* accept connections on, connect to, or listen on any port between
* 1024 and 65535 on the local host.
*
* <p>Note: Granting code permission to accept or make connections to remote
* hosts may be dangerous because malevolent code can then more easily
```

```
* transfer and share confidential data among parties who may not
* otherwise have access to the data.
*
* @see java.security.Permissions
* @see SocketPermission
*
*
* @author Marianne Mueller
* @author Roland Schemers
*
* @serial exclude

*/
/**
* This class provides the functionality of a cryptographic cipher for
* encryption and decryption. It forms the core of the Java Cryptographic
* Extension (JCE) framework.
*
* <p>In order to create a Cipher object, the application calls the
* Cipher's {@code getInstance} method, and passes the name of the
* requested transformation to it. Optionally, the name of a provider
* may be specified.
*
* <p>A transformation is a string that describes the operation (or
* set of operations) to be performed on the given input, to produce some

```
* output. A transformation always includes the name of a cryptographic
* algorithm (e.g., <i>AES</i>), and may be followed by a feedback mode and
*
 padding scheme.
*
* <p> A transformation is of the form:
*
* <ul>
* <li>"<i>algorithm/mode/padding</i>" or
*
* <li>"<i>algorithm</i>"
* </ul>
*
* <P> (in the latter case,
* provider-specific default values for the mode and padding scheme are used).
* For example, the following is a valid transformation:
*
* <pre>
*     Cipher c = Cipher.getInstance("<i>AES/CBC/PKCS5Padding</i>");
* </pre>
*
* Using modes such as {@code CFB} and {@code OFB}, block
* ciphers can encrypt data in units smaller than the cipher's actual
* block size.  When requesting such a mode, you may optionally specify
* the number of bits to be processed at a time by appending this number
* to the mode name as shown in the "{@code AES/CFB8/NoPadding}" and
* "{@code AES/OFB32/PKCS5Padding}" transformations. If no such
* number is specified, a provider-specific default is used.
* Thus, block ciphers can be turned into byte-oriented stream ciphers by
* using an 8 bit mode such as CFB8 or OFB8.
*
 <p>
* Modes such as Authenticated Encryption with Associated Data (AEAD)
* provide authenticity assurances for both confidential data and
* Additional Associated Data (AAD) that is not encrypted.  (Please see
* <a href="http://www.ietf.org/rfc/rfc5116.txt"> RFC 5116 </a> for more
* information on AEAD and AEAD algorithms such as GCM/CCM.) Both
* confidential and AAD data can be used when calculating the
* authentication tag (similar to a {@link Mac}).  This tag is appended
* to the ciphertext during encryption, and is verified on decryption.
* <p>
* AEAD modes such as GCM/CCM perform all AAD authenticity calculations
* before starting the ciphertext authenticity calculations.  To avoid
* implementations having to internally buffer ciphertext, all AAD data
* must be supplied to GCM/CCM implementations (via the {@code
* updateAAD} methods) <b>before</b> the ciphertext is processed (via
* the {@code update} and {@code doFinal} methods).
* <p>
```

```
* Note that GCM mode has a uniqueness
 requirement on IVs used in
* encryption with a given key. When IVs are repeated for GCM
* encryption, such usages are subject to forgery attacks. Thus, after
* each encryption operation using GCM mode, callers should re-initialize
* the cipher objects with GCM parameters which has a different IV value.
* <pre>
*     GCMParameterSpec s = ...;
*     cipher.init(..., s);
*
*     // If the GCM parameters were generated by the provider, it can
*     // be retrieved by:
*     // cipher.getParameters().getParameterSpec(GCMParameterSpec.class);
*
*     cipher.updateAAD(...);  // AAD
*     cipher.update(...);     // Multi-part update
*     cipher.doFinal(...);    // conclusion of operation
*
*     // Use a different IV value for every encryption
*     byte[] newIv = ...;
*     s = new GCMParameterSpec(s.getTLen(), newIv);
*     cipher.init(..., s);
*     ...
*
* </pre>
* Every implementation of the Java platform is required to support
* the following standard
 {@code Cipher} transformations with the keysizes
* in parentheses:
* <ul>
* <li>{@code AES/CBC/NoPadding} (128)</li>
* <li>{@code AES/CBC/PKCS5Padding} (128)</li>
* <li>{@code AES/ECB/NoPadding} (128)</li>
* <li>{@code AES/ECB/PKCS5Padding} (128)</li>
* <li>{@code DES/CBC/NoPadding} (56)</li>
* <li>{@code DES/CBC/PKCS5Padding} (56)</li>
* <li>{@code DES/ECB/NoPadding} (56)</li>
* <li>{@code DES/ECB/PKCS5Padding} (56)</li>
* <li>{@code DESede/CBC/NoPadding} (168)</li>
* <li>{@code DESede/CBC/PKCS5Padding} (168)</li>
* <li>{@code DESede/ECB/NoPadding} (168)</li>
* <li>{@code DESede/ECB/PKCS5Padding} (168)</li>
* <li>{@code RSA/ECB/PKCS1Padding} (1024, 2048)</li>
* <li>{@code RSA/ECB/OAEPWithSHA-1AndMGF1Padding} (1024, 2048)</li>
* <li>{@code RSA/ECB/OAEPWithSHA-256AndMGF1Padding} (1024, 2048)</li>
* </ul>
* These transformations are described in the
* <a href="{@docRoot}/../technotes/guides/security/StandardNames.html#Cipher">
```

```
* Cipher section</a> of the
* Java Cryptography
 Architecture Standard Algorithm Name Documentation.
* Consult the release documentation for your implementation to see if any
* other transformations are supported.
*

/**
   * Create an HTTPS client URL.  Traffic will be tunneled through any
   * intermediate nodes rather than proxied, so that confidentiality
   * of data exchanged can be preserved.  However, note that all the
   * anonymous SSL flavors are subject to "person-in-the-middle"
   * attacks against confidentiality.  If you enable use of those
   * flavors, you may be giving up the protection you get through
   * SSL tunneling.
   *
   * Use New to get new HttpsClient. This constructor is meant to be
   * used only by New method. New properly checks for URL spoofing.
   *
   * @param URL https URL with which a connection must be established

/**
*  The XMLStreamReader interface allows forward, read-only access to XML.
*  It is designed to be the lowest level and most efficient way to
*  read XML data.
*
* <p> The XMLStreamReader is designed to iterate over XML using
* next() and hasNext().  The data can be accessed using methods such as getEventType(),
* getNamespaceURI(), getLocalName() and getText();
*
* <p> The <a href="#next()">next()</a> method causes the reader to read the next parse event.
* The next() method returns an integer which identifies the type of event just read.
* <p> The event type can be determined using <a href="#getEventType()">getEventType()</a>.
* <p> Parsing events are defined as the XML Declaration, a DTD,
* start
 tag, character data, white space, end tag, comment,
* or processing instruction.  An attribute or namespace event may be encountered
* at the root level of a document as the result of a query operation.
*
* <p>For XML 1.0 compliance an XML processor must pass the
* identifiers of declared unparsed entities, notation declarations and their
* associated identifiers to the application.  This information is
* provided through the property API on this interface.
* The following two properties allow access to this information:
* javax.xml.stream.notations and javax.xml.stream.entities.
* When the current event is a DTD the following call will return a
* list of Notations
*  <code>List l = (List) getProperty("javax.xml.stream.notations");</code>
* The following call will return a list of entity declarations:
* <code>List l = (List) getProperty("javax.xml.stream.entities");</code>
* These properties can only be accessed during a DTD event and
* are defined to return null if the
 information is not available.
*
* <p>The following table describes which methods are valid in what state.
* If a method is called in an invalid state the method will throw a
* java.lang.IllegalStateException.
*
* <table border="2" rules="all" cellpadding="4">
```

```
*   <thead>
*     <tr>
*       <th align="center" colspan="2">
*         Valid methods for each state

*/
/**

```
* A class which enables secure communications using protocols such as
* the Secure Sockets Layer (SSL) or
* <A HREF="http://www.ietf.org/rfc/rfc2246.txt"> IETF RFC 2246 "Transport
* Layer Security" (TLS) </A> protocols, but is transport independent.
* <P>
* The secure communications modes include: <UL>
*
*      <LI> <em>Integrity Protection</em>.  SSL/TLS protects against
*      modification of messages by an active wiretapper.
*
*      <LI> <em>Authentication</em>.  In most modes, SSL/TLS provides
*      peer authentication.  Servers are usually authenticated, and
*      clients may be authenticated as requested by servers.
*
*      <LI> <em>Confidentiality (Privacy Protection)</em>.  In
 most
*      modes, SSL/TLS encrypts data being sent between client and
*      server.  This protects the confidentiality of data, so that
*      passive wiretappers won't see sensitive data such as financial
*      information or personal information of many kinds.
*
*      </UL>
*
* These kinds of protection are specified by a "cipher suite", which
* is a combination of cryptographic algorithms used by a given SSL
* connection.  During the negotiation process, the two endpoints must
* agree on a cipher suite that is available in both environments.  If
* there is no such suite in common, no SSL connection can be
* established, and no data can be exchanged.
* <P>
* The cipher suite used is established by a negotiation process called
* "handshaking".  The goal of this process is to create or rejoin a
* "session", which may protect many connections over time.  After
* handshaking has completed, you can access session attributes by
* using the {@link #getSession()} method.
 * <P>
* The <code>SSLSocket</code> class provides much of the same security
* functionality, but all of the inbound and outbound data is
* automatically transported using the underlying {@link
* java.net.Socket Socket}, which by design uses a blocking model.
* While this is appropriate for many applications, this model does not
* provide the scalability required by large servers.
* <P>
* The primary distinction of an <code>SSLEngine</code> is that it
* operates on inbound and outbound byte streams, independent of the
* transport mechanism.  It is the responsibility of the
* <code>SSLEngine</code> user to arrange for reliable I/O transport to
* the peer.  By separating the SSL/TLS abstraction from the I/O
```

```
* transport mechanism, the <code>SSLEngine</code> can be used for a
* wide variety of I/O types, such as {@link
* java.nio.channels.spi.AbstractSelectableChannel#configureBlocking(boolean)
* non-blocking I/O (polling)}, {@link java.nio.channels.Selector
* selectable
 non-blocking I/O}, {@link java.net.Socket Socket} and the
* traditional Input/OutputStreams, local {@link java.nio.ByteBuffer
* ByteBuffers} or byte arrays, <A
* HREF="http://www.jcp.org/en/jsr/detail?id=203"> future asynchronous
* I/O models </A>, and so on.
* <P>
* At a high level, the <code>SSLEngine</code> appears thus:
*
* <pre>
*                app data
*
*             |          ^
*             |    |     |
*             v    |     |
*         +----+-----|-----+----+
*         |         |         |
*         |      SSL|Engine    |
*   wrap() |         |         | unwrap()
*         | OUTBOUND | INBOUND  |
*         |         |         |
*         +----+-----|-----+----+
*             |    |     ^
*             |    |     |
*             v          |
*
*                net data
* </pre>
* Application data (also known as plaintext or cleartext) is data which
* is produced or consumed by an application.
  Its counterpart is
* network data, which consists of either handshaking and/or ciphertext
* (encrypted) data, and destined to be transported via an I/O
* mechanism.  Inbound data is data which has been received from the
* peer, and outbound data is destined for the peer.
* <P>
* (In the context of an <code>SSLEngine</code>, the term "handshake
* data" is taken to mean any data exchanged to establish and control a
* secure connection.  Handshake data includes the SSL/TLS messages
* "alert", "change_cipher_spec," and "handshake.")
* <P>
* There are five distinct phases to an <code>SSLEngine</code>.
*
* <OL>
```

```
*     <li> Creation - The <code>SSLEngine</code> has been created and
*     initialized, but has not yet been used.  During this phase, an
*     application may set any <code>SSLEngine</code>-specific settings
*     (enabled cipher suites, whether the <code>SSLEngine</code> should
*     handshake in client or server mode, and so on).  Once
*     handshaking has begun,
 though, any new settings (except
*     client/server mode, see below) will be used for
*     the next handshake.
*
*     <li> Initial Handshake - The initial handshake is a procedure by
*     which the two peers exchange communication parameters until an
*     SSLSession is established.  Application data can not be sent during
*     this phase.
*
*     <li> Application Data - Once the communication parameters have
*     been established and the handshake is complete, application data
*     may flow through the <code>SSLEngine</code>.  Outbound
*     application messages are encrypted and integrity protected,
*     and inbound messages reverse the process.
*
*     <li>  Rehandshaking - Either side may request a renegotiation of
*     the session at any time during the Application Data phase.  New
*     handshaking data can be intermixed among the application data.
*     Before starting the rehandshake phase, the application may
*     reset the SSL/TLS communication
 parameters such as the list of
*     enabled ciphersuites and whether to use client authentication,
*     but can not change between client/server modes.  As before, once
*     handshaking has begun, any new <code>SSLEngine</code>
*     configuration settings will not be used until the next
*     handshake.
*
*     <li>  Closure - When the connection is no longer needed, the
*     application should close the <code>SSLEngine</code> and should
*     send/receive any remaining messages to the peer before
*     closing the underlying transport mechanism.  Once an engine is
*     closed, it is not reusable:  a new <code>SSLEngine</code> must
*     be created.
* </OL>
* An <code>SSLEngine</code> is created by calling {@link
* SSLContext#createSSLEngine()} from an initialized
* <code>SSLContext</code>.  Any configuration
* parameters should be set before making the first call to
* <code>wrap()</code>, <code>unwrap()</code>, or
* <code>beginHandshake()</code>.  These methods
 all trigger the
* initial handshake.
```

```
* <P>
* Data moves through the engine by calling {@link #wrap(ByteBuffer,
* ByteBuffer) wrap()} or {@link #unwrap(ByteBuffer, ByteBuffer)
* unwrap()} on outbound or inbound data, respectively.  Depending on
* the state of the <code>SSLEngine</code>, a <code>wrap()</code> call
* may consume application data from the source buffer and may produce
* network data in the destination buffer.  The outbound data
* may contain application and/or handshake data.  A call to
* <code>unwrap()</code> will examine the source buffer and may
* advance the handshake if the data is handshaking information, or
* may place application data in the destination buffer if the data
* is application.  The state of the underlying SSL/TLS algorithm
* will determine when data is consumed and produced.
* <P>
* Calls to <code>wrap()</code> and <code>unwrap()</code> return an
* <code>SSLEngineResult</code> which indicates the status of the
* operation, and (optionally)
 how to interact with the engine to make
* progress.
* <P>
* The <code>SSLEngine</code> produces/consumes complete SSL/TLS
* packets only, and does not store application data internally between
* calls to <code>wrap()/unwrap()</code>.  Thus input and output
* <code>ByteBuffer</code>s must be sized appropriately to hold the
* maximum record that can be produced.  Calls to {@link
* SSLSession#getPacketBufferSize()} and {@link
* SSLSession#getApplicationBufferSize()} should be used to determine
* the appropriate buffer sizes.  The size of the outbound application
* data buffer generally does not matter.  If buffer conditions do not
* allow for the proper consumption/production of data, the application
* must determine (via {@link SSLEngineResult}) and correct the
* problem, and then try the call again.
* <P>
* For example, <code>unwrap()</code> will return a {@link
* SSLEngineResult.Status#BUFFER_OVERFLOW} result if the engine
* determines that there is not enough
 destination buffer space available.
* Applications should call {@link SSLSession#getApplicationBufferSize()}
* and compare that value with the space available in the destination buffer,
* enlarging the buffer if necessary.  Similarly, if <code>unwrap()</code>
* were to return a {@link SSLEngineResult.Status#BUFFER_UNDERFLOW}, the
* application should call {@link SSLSession#getPacketBufferSize()} to ensure
* that the source buffer has enough room to hold a record (enlarging if
* necessary), and then obtain more inbound data.
*
* <pre>{@code
*   SSLEngineResult r = engine.unwrap(src, dst);
*   switch (r.getStatus()) {
```

```
*   BUFFER_OVERFLOW:
*       // Could attempt to drain the dst buffer of any already obtained
*       // data, but we'll just increase it to the size needed.
*       int appSize = engine.getSession().getApplicationBufferSize();
*       ByteBuffer b = ByteBuffer.allocate(appSize + dst.position());
*       dst.flip();
*       b.put(dst);
*       dst =
 b;
*       // retry the operation.
*       break;
*   BUFFER_UNDERFLOW:
*       int netSize = engine.getSession().getPacketBufferSize();
*       // Resize buffer if needed.
*       if (netSize > dst.capacity()) {
*           ByteBuffer b = ByteBuffer.allocate(netSize);
*           src.flip();
*           b.put(src);
*           src = b;
*       }
*       // Obtain more inbound network data for src,
*       // then retry the operation.
*       break;
*   // other cases: CLOSED, OK.
*   }
* }</pre>
*
* <P>
* Unlike <code>SSLSocket</code>, all methods of SSLEngine are
* non-blocking.  <code>SSLEngine</code> implementations may
* require the results of tasks that may take an extended period of
* time to complete, or may even block.  For example, a TrustManager
* may need to connect to a remote certificate validation service,
* or a KeyManager might need to prompt a user to determine which
* certificate to use as part of client authentication.  Additionally,
* creating
 cryptographic signatures and verifying them can be slow,
* seemingly blocking.
* <P>
* For any operation which may potentially block, the
* <code>SSLEngine</code> will create a {@link java.lang.Runnable}
* delegated task.  When <code>SSLEngineResult</code> indicates that a
* delegated task result is needed, the application must call {@link
* #getDelegatedTask()} to obtain an outstanding delegated task and
* call its {@link java.lang.Runnable#run() run()} method (possibly using
* a different thread depending on the compute strategy).  The
* application should continue obtaining delegated tasks until no more
* exist, and try the original operation again.
```

```
* <P>
* At the end of a communication session, applications should properly
* close the SSL/TLS link.  The SSL/TLS protocols have closure handshake
* messages, and these messages should be communicated to the peer
* before releasing the <code>SSLEngine</code> and closing the
* underlying transport mechanism.  A close
 can be initiated by one of:
* an SSLException, an inbound closure handshake message, or one of the
* close methods.  In all cases, closure handshake messages are
* generated by the engine, and <code>wrap()</code> should be repeatedly
* called until the resulting <code>SSLEngineResult</code>'s status
* returns "CLOSED", or {@link #isOutboundDone()} returns true.  All
* data obtained from the <code>wrap()</code> method should be sent to the
* peer.
* <P>
* {@link #closeOutbound()} is used to signal the engine that the
* application will not be sending any more data.
* <P>
* A peer will signal its intent to close by sending its own closure
* handshake message.  After this message has been received and
* processed by the local <code>SSLEngine</code>'s <code>unwrap()</code>
* call, the application can detect the close by calling
* <code>unwrap()</code> and looking for a <code>SSLEngineResult</code>
* with status "CLOSED", or if {@link #isInboundDone()} returns true.
* If
 for some reason the peer closes the communication link without
* sending the proper SSL/TLS closure message, the application can
* detect the end-of-stream and can signal the engine via {@link
* #closeInbound()} that there will no more inbound messages to
* process.  Some applications might choose to require orderly shutdown
* messages from a peer, in which case they can check that the closure
* was generated by a handshake message and not by an end-of-stream
* condition.
* <P>
* There are two groups of cipher suites which you will need to know
* about when managing cipher suites:
*
* <UL>
*     <LI> <em>Supported</em> cipher suites:  all the suites which are
*     supported by the SSL implementation.  This list is reported
*     using {@link #getSupportedCipherSuites()}.
*
*     <LI> <em>Enabled</em> cipher suites, which may be fewer than
*     the full set of supported suites.  This group is set using the
*     {@link #setEnabledCipherSuites(String [])} method,
 and
*     queried using the {@link #getEnabledCipherSuites()} method.
*     Initially, a default set of cipher suites will be enabled on a
```

```
*      new engine that represents the minimum suggested
*      configuration.
* </UL>
*
* Implementation defaults require that only cipher suites which
* authenticate servers and provide confidentiality be enabled by
* default.  Only if both sides explicitly agree to unauthenticated
* and/or non-private (unencrypted) communications will such a
* cipher suite be selected.
* <P>
* Each SSL/TLS connection must have one client and one server, thus
* each endpoint must decide which role to assume.  This choice determines
* who begins the handshaking process as well as which type of messages
* should be sent by each party.  The method {@link
* #setUseClientMode(boolean)} configures the mode.  Once the initial
* handshaking has started, an <code>SSLEngine</code> can not switch
* between client and server modes, even when performing
 renegotiations.
* <P>
* Applications might choose to process delegated tasks in different
* threads.  When an <code>SSLEngine</code>
* is created, the current {@link java.security.AccessControlContext}
* is saved.  All future delegated tasks will be processed using this
* context:  that is, all access control decisions will be made using the
* context captured at engine creation.
*
* <HR>
*
* <B>Concurrency Notes</B>:
* There are two concurrency issues to be aware of:
*
* <OL>
*      <li>The <code>wrap()</code> and <code>unwrap()</code> methods
*      may execute concurrently of each other.
*
*      <li> The SSL/TLS protocols employ ordered packets.
*      Applications must take care to ensure that generated packets
*      are delivered in sequence.  If packets arrive
*      out-of-order, unexpected or fatal results may occur.
* <P>
*      For example:
*
*      <pre>
*            synchronized (outboundLock) {
*                sslEngine.wrap(src, dst);
 *                outboundQueue.put(dst);
*            }
*      </pre>
```

```
*
*     As a corollary, two threads must not attempt to call the same method
*     (either <code>wrap()</code> or <code>unwrap()</code>) concurrently,
*     because there is no way to guarantee the eventual packet ordering.
* </OL>

/**
* Java-specific class for dynamically loading SAX parsers.
*
```

```
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p><strong>Note:</strong> This class is designed to work with the now-deprecated
* SAX1 {@link org.xml.sax.Parser Parser} class.  SAX2 applications should use
* {@link org.xml.sax.helpers.XMLReaderFactory XMLReaderFactory} instead.</p>
*
* <p>ParserFactory is not part of the platform-independent definition
* of SAX; it is an additional convenience class designed
* specifically
 for Java XML application writers.  SAX applications
* can use the static methods in this class to allocate a SAX parser
* dynamically at run-time based either on the value of the
* `org.xml.sax.parser' system property or on a string containing the class
* name.</p>
*
* <p>Note that the application still requires an XML parser that
* implements SAX1.</p>
*
* @deprecated This class works with the deprecated
*            {@link org.xml.sax.Parser Parser}
*            interface.
* @since SAX 1.0
* @author David Megginson
* @version 2.0.1 (sax2r2)

*/
/**
* An engine that performs match operations on a {@linkplain java.lang.CharSequence
* character sequence} by interpreting a {@link Pattern}.
*
* <p> A matcher is created from a pattern by invoking the pattern's {@link
* Pattern#matcher matcher} method.  Once created, a matcher can be used to
* perform three different kinds of match operations:
*
* <ul>
*
*   <li><p> The {@link #matches matches} method attempts to match the entire
*   input sequence against the pattern.  </p></li>
*
*   <li><p> The {@link #lookingAt lookingAt} method attempts to match the
*   input sequence, starting at the beginning, against the pattern.  </p></li>
*
*   <li><p> The {@link #find find} method scans the input
 sequence looking for
*   the next subsequence that matches the pattern.  </p></li>
*
* </ul>
*
* <p> Each of these methods returns a boolean indicating success or failure.
* More information about a successful match can be obtained by querying the
* state of the matcher.
*
* <p> A matcher finds matches in a subset of its input called the
* <i>region</i>. By default, the region contains all of the matcher's input.
* The region can be modified via the{@link #region region} method and queried
```

```
* via the {@link #regionStart regionStart} and {@link #regionEnd regionEnd}
* methods. The way that the region boundaries interact with some pattern
* constructs can be changed. See {@link #useAnchoringBounds
* useAnchoringBounds} and {@link #useTransparentBounds useTransparentBounds}
* for more details.
*
* <p> This class also defines methods for replacing matched subsequences with
* new strings whose contents can, if desired, be computed from the match
* result.  The {@link #appendReplacement
 appendReplacement} and {@link
* #appendTail appendTail} methods can be used in tandem in order to collect
* the result into an existing string buffer, or the more convenient {@link
* #replaceAll replaceAll} method can be used to create a string in which every
* matching subsequence in the input sequence is replaced.
*
* <p> The explicit state of a matcher includes the start and end indices of
* the most recent successful match.  It also includes the start and end
* indices of the input subsequence captured by each <a
* href="Pattern.html#cg">capturing group</a> in the pattern as well as a total
* count of such subsequences.  As a convenience, methods are also provided for
* returning these captured subsequences in string form.
*
* <p> The explicit state of a matcher is initially undefined; attempting to
* query any part of it before a successful match will cause an {@link
* IllegalStateException} to be thrown.  The explicit state of a matcher is
* recomputed
 by every match operation.
*
* <p> The implicit state of a matcher includes the input character sequence as
* well as the <i>append position</i>, which is initially zero and is updated
* by the {@link #appendReplacement appendReplacement} method.
*
* <p> A matcher may be reset explicitly by invoking its {@link #reset()}
* method or, if a new input sequence is desired, its {@link
* #reset(java.lang.CharSequence) reset(CharSequence)} method.  Resetting a
* matcher discards its explicit state information and sets the append position
* to zero.
*
* <p> Instances of this class are not safe for use by multiple concurrent
* threads. </p>
*

// Public Domain: no warranty.
/**
* SAX2 extension handler for DTD declaration events.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This is an optional extension handler for SAX2 to provide more
* complete information about DTD declarations in an XML document.
* XML readers are not required to recognize this handler, and it
* is not part of core-only SAX2 distributions.</p>
*
* <p>Note that data-related DTD declarations (unparsed entities and
* notations) are already reported
 through the {@link
* org.xml.sax.DTDHandler DTDHandler} interface.</p>
*
* <p>If you are using the declaration handler together with a lexical
* handler, all of the events will occur between the
* {@link org.xml.sax.ext.LexicalHandler#startDTD startDTD} and the
* {@link org.xml.sax.ext.LexicalHandler#endDTD endDTD} events.</p>
*
* <p>To set the DeclHandler for an XML reader, use the
* {@link org.xml.sax.XMLReader#setProperty setProperty} method
* with the property name
* <code>http://xml.org/sax/properties/declaration-handler</code>
* and an object implementing this interface (or null) as the value.
* If the reader does not report declaration events, it will throw a
* {@link org.xml.sax.SAXNotRecognizedException SAXNotRecognizedException}
* when you attempt to register the handler.</p>
*
* @since SAX 2.0 (extensions 1.0)
* @author David Megginson

*/
/**
* This class extends <code>Socket</code>s and provides secure
* socket using protocols such as the "Secure
* Sockets Layer" (SSL) or IETF "Transport Layer Security" (TLS) protocols.
* <P>
* Such sockets are normal stream sockets, but they
* add a layer of security protections over the underlying network transport
* protocol, such as TCP.  Those protections include: <UL>
*
*     <LI> <em>Integrity Protection</em>.  SSL protects against
*     modification of messages by an active wiretapper.
*
*     <LI> <em>Authentication</em>.  In most modes, SSL provides
*     peer authentication.  Servers are usually authenticated,
*     and clients may be authenticated as requested by servers.
*
*
    <LI> <em>Confidentiality (Privacy Protection)</em>.  In most
*     modes, SSL encrypts data being sent between client and server.
*     This protects the confidentiality of data, so that passive
*     wiretappers won't see sensitive data such as financial
*     information or personal information of many kinds.
*
*     </UL>
*
* <P>These kinds of protection are specified by a "cipher suite", which
* is a combination of cryptographic algorithms used by a given SSL connection.
* During the negotiation process, the two endpoints must agree on
* a ciphersuite that is available in both environments.
* If there is no such suite in common, no SSL connection can
* be established, and no data can be exchanged.
*
* <P> The cipher suite used is established by a negotiation process
* called "handshaking".  The goal of this
* process is to create or rejoin a "session", which may protect many
* connections over time.  After handshaking has completed, you can access
* session
 attributes by using the <em>getSession</em> method.
* The initial handshake on this connection can be initiated in
```

```
* one of three ways: <UL>
*
*     <LI> calling <code>startHandshake</code> which explicitly
*          begins handshakes, or
*     <LI> any attempt to read or write application data on
*          this socket causes an implicit handshake, or
*     <LI> a call to <code>getSession</code> tries to set up a session
*          if there is no currently valid session, and
*          an implicit handshake is done.
* </UL>
*
* <P>If handshaking fails for any reason, the <code>SSLSocket</code>
* is closed, and no further communications can be done.
*
* <P>There are two groups of cipher suites which you will need to know
* about when managing cipher suites: <UL>
*
*     <LI> <em>Supported</em> cipher suites:  all the suites which are
*     supported by the SSL implementation.  This list is reported
*     using <em>getSupportedCipherSuites</em>.
 *
*     <LI> <em>Enabled</em> cipher suites, which may be fewer
*     than the full set of supported suites.  This group is
*     set using the <em>setEnabledCipherSuites</em> method, and
*     queried using the <em>getEnabledCipherSuites</em> method.
*     Initially, a default set of cipher suites will be enabled on
*     a new socket that represents the minimum suggested configuration.
*
*     </UL>
*
* <P> Implementation defaults require that only cipher
* suites which authenticate servers and provide confidentiality
* be enabled by default.
* Only if both sides explicitly agree to unauthenticated and/or
* non-private (unencrypted) communications will such a ciphersuite be
* selected.
*
* <P>When <code>SSLSocket</code>s are first created, no handshaking
* is done so that applications may first set their communication
* preferences:  what cipher suites to use, whether the socket should be
* in client or server mode, etc.
* However, security is always
 provided by the time that application data
* is sent over the connection.
*
* <P> You may register to receive event notification of handshake
* completion.  This involves
* the use of two additional classes.  <em>HandshakeCompletedEvent</em>
```

```
* objects are passed to <em>HandshakeCompletedListener</em> instances,
* which are registered by users of this API.
*
* <code>SSLSocket</code>s are created by <code>SSLSocketFactory</code>s,
* or by <code>accept</code>ing a connection from a
* <code>SSLServerSocket</code>.
*
* <P>A SSL socket must choose to operate in the client or server mode.
* This will determine who begins the handshaking process, as well
* as which messages should be sent by each party.  Each
* connection must have one client and one server, or handshaking
* will not progress properly.  Once the initial handshaking has started, a
* socket can not switch between client and server modes, even when
* performing renegotiations.
*
* @see java.net.Socket
*
 @see SSLServerSocket
* @see SSLSocketFactory
*
* @since 1.4
* @author David Brownell

/**
    * Constructs a new {@link LocalVariableAnnotationNode}. <i>Subclasses must
    * not use this constructor</i>. Instead, they must use the
    * {@link #LocalVariableAnnotationNode(int, TypePath, LabelNode[], LabelNode[], int[], String)}
    * version.
    *
    * @param typeRef
    *          a reference to the annotated type. See {@link TypeReference}.
    * @param typePath
    *          the path to the annotated type argument, wildcard bound, array
    *          element type, or static inner type within 'typeRef'. May be
    *          <tt>null</tt> if the annotation targets 'typeRef' as a whole.
    * @param start
    *          the fist instructions corresponding to the continuous ranges
```

```
   *          that make the scope of this local variable (inclusive).
   * @param end
   *          the last instructions corresponding to the continuous ranges

  *          that make the scope of this local variable (exclusive). This
   *          array must have the same size as the 'start' array.
   * @param index
   *          the local variable's index in each range. This array must have
   *          the same size as the 'start' array.
   * @param desc
   *          the class descriptor of the annotation class.

*/
/**
* This class implements a proprietary password-based encryption algorithm.
* It is based on password-based encryption as defined by the PKCS #5
* standard, except that is uses triple DES instead of DES.
*
* Here's how this algorithm works:
*

```
* 1. Create random salt and split it in two halves. If the two halves are
*    identical, invert one of them.
* 2. Concatenate password with each of the halves.
* 3. Digest each concatenation with c iterations, where c is the
*    iterationCount. Concatenate the output from each digest round with the
*    password, and use the result as the input to the next digest operation.
*    The digest algorithm is MD5.
* 4. After c iterations, use the 2 resulting
 digests as follows:
*    The 16 bytes of the first digest and the 1st 8 bytes of the 2nd digest
*    form the triple DES key, and the last 8 bytes of the 2nd digest form the
*    IV.
*
* @author Jan Luehe
* @see javax.crypto.Cipher

/**
* This class is for security permissions.
* A SecurityPermission contains a name (also referred to as a "target name")
* but no actions list; you either have the named permission
* or you don't.
* <P>
* The target name is the name of a security configuration parameter (see below).
* Currently the SecurityPermission object is used to guard access
* to the Policy, Security, Provider, Signer, and Identity
* objects.
* <P>
```

```
* The following table lists all the possible SecurityPermission target names,
* and for each provides a description of what the permission allows
* and a discussion of the risks of granting code the permission.
*
* <table border=1 cellpadding=5 summary="target name,what the
 permission allows, and associated risks">
* <tr>
* <th>Permission Target Name</th>
* <th>What the Permission Allows</th>
* <th>Risks of Allowing this Permission</th>
* </tr>
*
* <tr>
*   <td>createAccessControlContext</td>
*   <td>Creation of an AccessControlContext</td>
*   <td>This allows someone to instantiate an AccessControlContext
* with a {@code DomainCombiner}.  Extreme care must be taken when
* granting this permission. Malicious code could create a DomainCombiner
* that augments the set of permissions granted to code, and even grant the
* code {@link java.security.AllPermission}.</td>
* </tr>
*
* <tr>
*   <td>getDomainCombiner</td>
*   <td>Retrieval of an AccessControlContext's DomainCombiner</td>
*   <td>This allows someone to retrieve an AccessControlContext's
* {@code DomainCombiner}.  Since DomainCombiners may contain
* sensitive information, this could potentially lead to a privacy leak.</td>
* </tr>
*
* <tr>
*   <td>getPolicy</td>
*   <td>Retrieval
 of the system-wide security policy (specifically, of the
* currently-installed Policy object)</td>
*   <td>This allows someone to query the policy via the
* {@code getPermissions} call,
* which discloses which permissions would be granted to a given CodeSource.
* While revealing the policy does not compromise the security of
* the system, it does provide malicious code with additional information
* which it may use to better aim an attack. It is wise
* not to divulge more information than necessary.</td>
* </tr>
*
* <tr>
*   <td>setPolicy</td>
*   <td>Setting of the system-wide security policy (specifically,
* the Policy object)</td>
```

```
*   <td>Granting this permission is extremely dangerous, as malicious
* code may grant itself all the necessary permissions it needs
* to successfully mount an attack on the system.</td>
* </tr>
*
* <tr>
*   <td>createPolicy.{policy type}</td>
*   <td>Getting an instance of a Policy implementation from a provider</td>
*   <td>Granting
 this permission enables code to obtain a Policy object.
* Malicious code may query the Policy object to determine what permissions
* have been granted to code other than itself. </td>
* </tr>
*
* <tr>
*   <td>getProperty.{key}</td>
*   <td>Retrieval of the security property with the specified key</td>
*   <td>Depending on the particular key for which access has
* been granted, the code may have access to the list of security
* providers, as well as the location of the system-wide and user
* security policies.  while revealing this information does not
* compromise the security of the system, it does provide malicious
* code with additional information which it may use to better aim
* an attack.
</td>
* </tr>
*
* <tr>
*   <td>setProperty.{key}</td>
*   <td>Setting of the security property with the specified key</td>
*   <td>This could include setting a security provider or defining
* the location of the system-wide security policy.  Malicious
* code that has
 permission to set a new security provider may
* set a rogue provider that steals confidential information such
* as cryptographic private keys. In addition, malicious code with
* permission to set the location of the system-wide security policy
* may point it to a security policy that grants the attacker
* all the necessary permissions it requires to successfully mount
* an attack on the system.
</td>
* </tr>
*
* <tr>
*   <td>insertProvider</td>
*   <td>Addition of a new provider</td>
*   <td>This would allow somebody to introduce a possibly
* malicious provider (e.g., one that discloses the private keys passed
```

```
* to it) as the highest-priority provider. This would be possible
* because the Security object (which manages the installed providers)
* currently does not check the integrity or authenticity of a provider
* before attaching it. The "insertProvider" permission subsumes the
* "insertProvider.{provider name}" permission (see the section below for
* more information).
 * </td>
* </tr>
*
* <tr>
*   <td>removeProvider.{provider name}</td>
*   <td>Removal of the specified provider</td>
*   <td>This may change the behavior or disable execution of other
* parts of the program. If a provider subsequently requested by the
* program has been removed, execution may fail. Also, if the removed
* provider is not explicitly requested by the rest of the program, but
* it would normally be the provider chosen when a cryptography service
* is requested (due to its previous order in the list of providers),
* a different provider will be chosen instead, or no suitable provider
* will be found, thereby resulting in program failure.</td>
* </tr>
*
* <tr>
*   <td>clearProviderProperties.{provider name}</td>
*   <td>"Clearing" of a Provider so that it no longer contains the properties
* used to look up services implemented by the provider</td>
*   <td>This disables the lookup of services implemented by the provider.
* This may thus change the
 behavior or disable execution of other
* parts of the program that would normally utilize the Provider, as
* described under the "removeProvider.{provider name}" permission.</td>
* </tr>
*
* <tr>
*   <td>putProviderProperty.{provider name}</td>
*   <td>Setting of properties for the specified Provider</td>
*   <td>The provider properties each specify the name and location
* of a particular service implemented by the provider. By granting
* this permission, you let code replace the service specification
* with another one, thereby specifying a different implementation.</td>
* </tr>
*
* <tr>
*   <td>removeProviderProperty.{provider name}</td>
*   <td>Removal of properties from the specified Provider</td>
*   <td>This disables the lookup of services implemented by the
* provider. They are no longer accessible due to removal of the properties
* specifying their names and locations. This
```

```
* may change the behavior or disable execution of other
* parts of the program that
 would normally utilize the Provider, as
* described under the "removeProvider.{provider name}" permission.</td>
* </tr>
*
* </table>
*
* <P>
* The following permissions have been superseded by newer permissions or are
* associated with classes that have been deprecated: {@link Identity},
* {@link IdentityScope}, {@link Signer}. Use of them is discouraged. See the
* applicable classes for more information.
*
* <table border=1 cellpadding=5 summary="target name,what the permission allows, and associated risks">
* <tr>
* <th>Permission Target Name</th>
* <th>What the Permission Allows</th>
* <th>Risks of Allowing this Permission</th>
* </tr>
*
* <tr>
*   <td>insertProvider.{provider name}</td>
*   <td>Addition of a new provider, with the specified name</td>
*   <td>Use of this permission is discouraged from further use because it is
* possible to circumvent the name restrictions by overriding the
* {@link java.security.Provider#getName} method. Also, there is an
 equivalent
* level of risk associated with granting code permission to insert a provider
* with a specific name, or any name it chooses. Users should use the
* "insertProvider" permission instead.
* <p>This would allow somebody to introduce a possibly
* malicious provider (e.g., one that discloses the private keys passed
* to it) as the highest-priority provider. This would be possible
* because the Security object (which manages the installed providers)
* currently does not check the integrity or authenticity of a provider
* before attaching it.</td>
* </tr>
*
* <tr>
*   <td>setSystemScope</td>
*   <td>Setting of the system identity scope</td>
*   <td>This would allow an attacker to configure the system identity scope with
* certificates that should not be trusted, thereby granting applet or
* application code signed with those certificates privileges that
* would have been denied by the system's original identity scope.</td>
* </tr>
*
```

```
* <tr>
*   <td>setIdentityPublicKey</td>
 *   <td>Setting of the public key for an Identity</td>
*   <td>If the identity is marked as "trusted", this allows an attacker to
* introduce a different public key (e.g., its own) that is not trusted
* by the system's identity scope, thereby granting applet or
* application code signed with that public key privileges that
* would have been denied otherwise.</td>
* </tr>
*
* <tr>
*   <td>setIdentityInfo</td>
*   <td>Setting of a general information string for an Identity</td>
*   <td>This allows attackers to set the general description for
* an identity.  This may trick applications into using a different
* identity than intended or may prevent applications from finding a
* particular identity.</td>
* </tr>
*
* <tr>
*   <td>addIdentityCertificate</td>
*   <td>Addition of a certificate for an Identity</td>
*   <td>This allows attackers to set a certificate for
* an identity's public key.  This is dangerous because it affects
* the trust relationship
 across the system. This public key suddenly
* becomes trusted to a wider audience than it otherwise would be.</td>
* </tr>
*
* <tr>
*   <td>removeIdentityCertificate</td>
*   <td>Removal of a certificate for an Identity</td>
*   <td>This allows attackers to remove a certificate for
* an identity's public key. This is dangerous because it affects
* the trust relationship across the system. This public key suddenly
* becomes considered less trustworthy than it otherwise would be.</td>
* </tr>
*
* <tr>
*  <td>printIdentity</td>
*  <td>Viewing the name of a principal
* and optionally the scope in which it is used, and whether
* or not it is considered "trusted" in that scope</td>
*  <td>The scope that is printed out may be a filename, in which case
* it may convey local system information. For example, here's a sample
* printout of an identity named "carol", who is
* marked not trusted in the user's identity database:<br>
*   carol[/home/luehe/identitydb.obj][not trusted]</td>
```

```
 *</tr>
*
* <tr>
*   <td>getSignerPrivateKey</td>
*   <td>Retrieval of a Signer's private key</td>
*   <td>It is very dangerous to allow access to a private key; private
* keys are supposed to be kept secret. Otherwise, code can use the
* private key to sign various files and claim the signature came from
* the Signer.</td>
* </tr>
*
* <tr>
*   <td>setSignerKeyPair</td>
*   <td>Setting of the key pair (public key and private key) for a Signer</td>
*   <td>This would allow an attacker to replace somebody else's (the "target's")
* keypair with a possibly weaker keypair (e.g., a keypair of a smaller
* keysize).  This also would allow the attacker to listen in on encrypted
* communication between the target and its peers. The target's peers
* might wrap an encryption session key under the target's "new" public
* key, which would allow the attacker (who possesses the corresponding
* private key) to unwrap the session key and decipher the communication
* data encrypted
 under that session key.</td>

/**
* Classes to support functional-style operations on streams of elements, such
* as map-reduce transformations on collections.  For example:
*
* <pre>{@code
*     int sum = widgets.stream()
*                 .filter(b -> b.getColor() == RED)
*                 .mapToInt(b -> b.getWeight())
*                 .sum();
```

```
* }</pre>
*
* <p>Here we use {@code widgets}, a {@code Collection<Widget>},
* as a source for a stream, and then perform a filter-map-reduce on the stream
* to obtain the sum of the weights of the red widgets.  (Summation is an
* example of a <a href="package-summary.html#Reduction">reduction</a>
* operation.)
*
* <p>The key abstraction introduced in this package
 is <em>stream</em>.  The
* classes {@link java.util.stream.Stream}, {@link java.util.stream.IntStream},
* {@link java.util.stream.LongStream}, and {@link java.util.stream.DoubleStream}
* are streams over objects and the primitive {@code int}, {@code long} and
* {@code double} types.  Streams differ from collections in several ways:
*
* <ul>
*     <li>No storage.  A stream is not a data structure that stores elements;
*     instead, it conveys elements from a source such as a data structure,
*     an array, a generator function, or an I/O channel, through a pipeline of
*     computational operations.</li>
*     <li>Functional in nature.  An operation on a stream produces a result,
*     but does not modify its source.  For example, filtering a {@code Stream}
*     obtained from a collection produces a new {@code Stream} without the
*     filtered elements, rather than removing elements from the source
*     collection.</li>
*     <li>Laziness-seeking.  Many stream operations,
 such as filtering, mapping,
*     or duplicate removal, can be implemented lazily, exposing opportunities
*     for optimization.  For example, "find the first {@code String} with
*     three consecutive vowels" need not examine all the input strings.
*     Stream operations are divided into intermediate ({@code Stream}-producing)
*     operations and terminal (value- or side-effect-producing) operations.
*     Intermediate operations are always lazy.</li>
*     <li>Possibly unbounded.  While collections have a finite size, streams
*     need not.  Short-circuiting operations such as {@code limit(n)} or
*     {@code findFirst()} can allow computations on infinite streams to
*     complete in finite time.</li>
*     <li>Consumable. The elements of a stream are only visited once during
*     the life of a stream. Like an {@link java.util.Iterator}, a new stream
*     must be generated to revisit the same elements of the source.
*     </li>
* </ul>
*
* Streams can be
 obtained in a number of ways. Some examples include:
* <ul>
*     <li>From a {@link java.util.Collection} via the {@code stream()} and
*     {@code parallelStream()} methods;</li>
```

```
*     <li>From an array via {@link java.util.Arrays#stream(Object[])};</li>
*     <li>From static factory methods on the stream classes, such as
*     {@link java.util.stream.Stream#of(Object[])},
*     {@link java.util.stream.IntStream#range(int, int)}
*     or {@link java.util.stream.Stream#iterate(Object, UnaryOperator)};</li>
*     <li>The lines of a file can be obtained from {@link java.io.BufferedReader#lines()};</li>
*     <li>Streams of file paths can be obtained from methods in {@link java.nio.file.Files};</li>
*     <li>Streams of random numbers can be obtained from {@link java.util.Random#ints()};</li>
*     <li>Numerous other stream-bearing methods in the JDK, including
*     {@link java.util.BitSet#stream()},
*     {@link java.util.regex.Pattern#splitAsStream(java.lang.CharSequence)},
 *     and {@link java.util.jar.JarFile#stream()}.</li>
* </ul>
*
* <p>Additional stream sources can be provided by third-party libraries using
* <a href="package-summary.html#StreamSources">these techniques</a>.
*
* <h2><a name="StreamOps">Stream operations and pipelines</a></h2>
*
* <p>Stream operations are divided into <em>intermediate</em> and
* <em>terminal</em> operations, and are combined to form <em>stream
* pipelines</em>.  A stream pipeline consists of a source (such as a
* {@code Collection}, an array, a generator function, or an I/O channel);
* followed by zero or more intermediate operations such as
* {@code Stream.filter} or {@code Stream.map}; and a terminal operation such
* as {@code Stream.forEach} or {@code Stream.reduce}.
*
* <p>Intermediate operations return a new stream.  They are always
* <em>lazy</em>; executing an intermediate operation such as
* {@code filter()} does not actually perform any filtering, but instead
* creates a new stream
 that, when traversed, contains the elements of
* the initial stream that match the given predicate.  Traversal
* of the pipeline source does not begin until the terminal operation of the
* pipeline is executed.
*
* <p>Terminal operations, such as {@code Stream.forEach} or
* {@code IntStream.sum}, may traverse the stream to produce a result or a
* side-effect. After the terminal operation is performed, the stream pipeline
* is considered consumed, and can no longer be used; if you need to traverse
* the same data source again, you must return to the data source to get a new
* stream.  In almost all cases, terminal operations are <em>eager</em>,
* completing their traversal of the data source and processing of the pipeline
* before returning.  Only the terminal operations {@code iterator()} and
* {@code spliterator()} are not; these are provided as an "escape hatch" to enable
* arbitrary client-controlled pipeline traversals in the event that the
* existing operations are
```

```
 not sufficient to the task.
*
* <p> Processing streams lazily allows for significant efficiencies; in a
* pipeline such as the filter-map-sum example above, filtering, mapping, and
* summing can be fused into a single pass on the data, with minimal
* intermediate state. Laziness also allows avoiding examining all the data
* when it is not necessary; for operations such as "find the first string
* longer than 1000 characters", it is only necessary to examine just enough
* strings to find one that has the desired characteristics without examining
* all of the strings available from the source. (This behavior becomes even
* more important when the input stream is infinite and not merely large.)
*
* <p>Intermediate operations are further divided into <em>stateless</em>
* and <em>stateful</em> operations. Stateless operations, such as {@code filter}
* and {@code map}, retain no state from previously seen element when processing
* a new element -- each element can be processed
 * independently of operations on other elements.  Stateful operations, such as
* {@code distinct} and {@code sorted}, may incorporate state from previously
* seen elements when processing new elements.
*
* <p>Stateful operations may need to process the entire input
* before producing a result.  For example, one cannot produce any results from
* sorting a stream until one has seen all elements of the stream.  As a result,
* under parallel computation, some pipelines containing stateful intermediate
* operations may require multiple passes on the data or may need to buffer
* significant data.  Pipelines containing exclusively stateless intermediate
* operations can be processed in a single pass, whether sequential or parallel,
* with minimal data buffering.
*
* <p>Further, some operations are deemed <em>short-circuiting</em> operations.
* An intermediate operation is short-circuiting if, when presented with
* infinite input, it may produce a finite stream as a result.  A
 terminal
* operation is short-circuiting if, when presented with infinite input, it may
* terminate in finite time.  Having a short-circuiting operation in the pipeline
* is a necessary, but not sufficient, condition for the processing of an infinite
* stream to terminate normally in finite time.
*
* <h3>Parallelism</h3>
*
* <p>Processing elements with an explicit {@code for-}loop is inherently serial.
* Streams facilitate parallel execution by reframing the computation as a pipeline of
* aggregate operations, rather than as imperative operations on each individual
* element.  All streams operations can execute either in serial or in parallel.
* The stream implementations in the JDK create serial streams unless parallelism is
* explicitly requested.  For example, {@code Collection} has methods
* {@link java.util.Collection#stream} and {@link java.util.Collection#parallelStream},
* which produce sequential and parallel streams respectively; other
```

```
* stream-bearing methods
 such as {@link java.util.stream.IntStream#range(int, int)}
* produce sequential streams but these streams can be efficiently parallelized by
* invoking their {@link java.util.stream.BaseStream#parallel()} method.
* To execute the prior "sum of weights of widgets" query in parallel, we would
* do:
*
* <pre>{@code
*     int sumOfWeights = widgets.}<code><b>parallelStream()</b></code>{@code
*                         .filter(b -> b.getColor() == RED)
*                         .mapToInt(b -> b.getWeight())
*                         .sum();
* }</pre>
*
* <p>The only difference between the serial and parallel versions of this
* example is the creation of the initial stream, using "{@code parallelStream()}"
* instead of "{@code stream()}".  When the terminal operation is initiated,
* the stream pipeline is executed sequentially or in parallel depending on the
* orientation of the stream on which it is invoked.  Whether a stream will execute in serial or
*
 parallel can be determined with the {@code isParallel()} method, and the
* orientation of a stream can be modified with the
* {@link java.util.stream.BaseStream#sequential()} and
* {@link java.util.stream.BaseStream#parallel()} operations.  When the terminal
* operation is initiated, the stream pipeline is executed sequentially or in
* parallel depending on the mode of the stream on which it is invoked.
*
* <p>Except for operations identified as explicitly nondeterministic, such
* as {@code findAny()}, whether a stream executes sequentially or in parallel
* should not change the result of the computation.
*
* <p>Most stream operations accept parameters that describe user-specified
* behavior, which are often lambda expressions.  To preserve correct behavior,
* these <em>behavioral parameters</em> must be <em>non-interfering</em>, and in
* most cases must be <em>stateless</em>.  Such parameters are always instances
* of a <a href="../function/package-summary.html">functional
 interface</a> such
* as {@link java.util.function.Function}, and are often lambda expressions or
* method references.
*
* <h3><a name="NonInterference">Non-interference</a></h3>
*
* Streams enable you to execute possibly-parallel aggregate operations over a
* variety of data sources, including even non-thread-safe collections such as
* {@code ArrayList}. This is possible only if we can prevent
* <em>interference</em> with the data source during the execution of a stream
* pipeline.  Except for the escape-hatch operations {@code iterator()} and
* {@code spliterator()}, execution begins when the terminal operation is
```

```
* invoked, and ends when the terminal operation completes.  For most data
* sources, preventing interference means ensuring that the data source is
* <em>not modified at all</em> during the execution of the stream pipeline.
* The notable exception to this are streams whose sources are concurrent
* collections, which are specifically designed to handle concurrent
 modification.
* Concurrent stream sources are those whose {@code Spliterator} reports the
* {@code CONCURRENT} characteristic.
*
* <p>Accordingly, behavioral parameters in stream pipelines whose source might
* not be concurrent should never modify the stream's data source.
* A behavioral parameter is said to <em>interfere</em> with a non-concurrent
* data source if it modifies, or causes to be
* modified, the stream's data source.  The need for non-interference applies
* to all pipelines, not just parallel ones.  Unless the stream source is
* concurrent, modifying a stream's data source during execution of a stream
* pipeline can cause exceptions, incorrect answers, or nonconformant behavior.
*
* For well-behaved stream sources, the source can be modified before the
* terminal operation commences and those modifications will be reflected in
* the covered elements.  For example, consider the following code:
*
* <pre>{@code
*     List<String> l = new ArrayList(Arrays.asList("one",
 "two"));
*     Stream<String> sl = l.stream();
*     l.add("three");
*     String s = sl.collect(joining(" "));
* }</pre>
*
* First a list is created consisting of two strings: "one"; and "two". Then a
* stream is created from that list. Next the list is modified by adding a third
* string: "three". Finally the elements of the stream are collected and joined
* together. Since the list was modified before the terminal {@code collect}
* operation commenced the result will be a string of "one two three". All the
* streams returned from JDK collections, and most other JDK classes,
* are well-behaved in this manner; for streams generated by other libraries, see
* <a href="package-summary.html#StreamSources">Low-level stream
* construction</a> for requirements for building well-behaved streams.
*
* <h3><a name="Statelessness">Stateless behaviors</a></h3>
*
* Stream pipeline results may be nondeterministic or incorrect if the behavioral
* parameters to the
 stream operations are <em>stateful</em>.  A stateful lambda
* (or other object implementing the appropriate functional interface) is one
* whose result depends on any state which might change during the execution
* of the stream pipeline.  An example of a stateful lambda is the parameter
```

```
* to {@code map()} in:
*
* <pre>{@code
*     Set<Integer> seen = Collections.synchronizedSet(new HashSet<>());
*     stream.parallel().map(e -> { if (seen.add(e)) return 0; else return e; })...
* }</pre>
*
* Here, if the mapping operation is performed in parallel, the results for the
* same input could vary from run to run, due to thread scheduling differences,
* whereas, with a stateless lambda expression the results would always be the
* same.
*
* <p>Note also that attempting to access mutable state from behavioral parameters
* presents you with a bad choice with respect to safety and performance; if
* you do not synchronize access to that state, you have a data race and
* therefore
 your code is broken, but if you do synchronize access to that
* state, you risk having contention undermine the parallelism you are seeking
* to benefit from.  The best approach is to avoid stateful behavioral
* parameters to stream operations entirely; there is usually a way to
* restructure the stream pipeline to avoid statefulness.
*
* <h3>Side-effects</h3>
*
* Side-effects in behavioral parameters to stream operations are, in general,
* discouraged, as they can often lead to unwitting violations of the
* statelessness requirement, as well as other thread-safety hazards.
*
* <p>If the behavioral parameters do have side-effects, unless explicitly
* stated, there are no guarantees as to the
* <a href="../concurrent/package-summary.html#MemoryVisibility"><i>visibility</i></a>
* of those side-effects to other threads, nor are there any guarantees that
* different operations on the "same" element within the same stream pipeline
* are executed in the same thread.  Further,
 the ordering of those effects
* may be surprising.  Even when a pipeline is constrained to produce a
* <em>result</em> that is consistent with the encounter order of the stream
* source (for example, {@code IntStream.range(0,5).parallel().map(x -> x*2).toArray()}
* must produce {@code [0, 2, 4, 6, 8]}), no guarantees are made as to the order
* in which the mapper function is applied to individual elements, or in what
* thread any behavioral parameter is executed for a given element.
*
* <p>Many computations where one might be tempted to use side effects can be more
* safely and efficiently expressed without side-effects, such as using
* <a href="package-summary.html#Reduction">reduction</a> instead of mutable
* accumulators. However, side-effects such as using {@code println()} for debugging
* purposes are usually harmless.  A small number of stream operations, such as
* {@code forEach()} and {@code peek()}, can operate only via side-effects;
```

```
* these should be used
 with care.
*
* <p>As an example of how to transform a stream pipeline that inappropriately
* uses side-effects to one that does not, the following code searches a stream
* of strings for those matching a given regular expression, and puts the
* matches in a list.
*
* <pre>{@code
*     ArrayList<String> results = new ArrayList<>();
*     stream.filter(s -> pattern.matcher(s).matches())
*           .forEach(s -> results.add(s));  // Unnecessary use of side-effects!
* }</pre>
*
* This code unnecessarily uses side-effects.  If executed in parallel, the
* non-thread-safety of {@code ArrayList} would cause incorrect results, and
* adding needed synchronization would cause contention, undermining the
* benefit of parallelism.  Furthermore, using side-effects here is completely
* unnecessary; the {@code forEach()} can simply be replaced with a reduction
* operation that is safer, more efficient, and more amenable to
* parallelization:
*
* <pre>{@code
*     List<String>results
 =
*         stream.filter(s -> pattern.matcher(s).matches())
*               .collect(Collectors.toList());  // No side-effects!
* }</pre>
*
* <h3><a name="Ordering">Ordering</a></h3>
*
* <p>Streams may or may not have a defined <em>encounter order</em>.  Whether
* or not a stream has an encounter order depends on the source and the
* intermediate operations.  Certain stream sources (such as {@code List} or
* arrays) are intrinsically ordered, whereas others (such as {@code HashSet})
* are not.  Some intermediate operations, such as {@code sorted()}, may impose
* an encounter order on an otherwise unordered stream, and others may render an
* ordered stream unordered, such as {@link java.util.stream.BaseStream#unordered()}.
* Further, some terminal operations may ignore encounter order, such as
* {@code forEach()}.
*
* <p>If a stream is ordered, most operations are constrained to operate on the
* elements in their encounter order; if the source of a stream is a {@code
 List}
* containing {@code [1, 2, 3]}, then the result of executing {@code map(x -> x*2)}
* must be {@code [2, 4, 6]}.  However, if the source has no defined encounter
* order, then any permutation of the values {@code [2, 4, 6]} would be a valid
* result.
```

```
*
* <p>For sequential streams, the presence or absence of an encounter order does
* not affect performance, only determinism.  If a stream is ordered, repeated
* execution of identical stream pipelines on an identical source will produce
* an identical result; if it is not ordered, repeated execution might produce
* different results.
*
* <p>For parallel streams, relaxing the ordering constraint can sometimes enable
* more efficient execution.  Certain aggregate operations,
* such as filtering duplicates ({@code distinct()}) or grouped reductions
* ({@code Collectors.groupingBy()}) can be implemented more efficiently if ordering of elements
* is not relevant.  Similarly, operations that are intrinsically tied to
 encounter order,
* such as {@code limit()}, may require
* buffering to ensure proper ordering, undermining the benefit of parallelism.
* In cases where the stream has an encounter order, but the user does not
* particularly <em>care</em> about that encounter order, explicitly de-ordering
* the stream with {@link java.util.stream.BaseStream#unordered() unordered()} may
* improve parallel performance for some stateful or terminal operations.
* However, most stream pipelines, such as the "sum of weight of blocks" example
* above, still parallelize efficiently even under ordering constraints.
*
* <h2><a name="Reduction">Reduction operations</a></h2>
*
* A <em>reduction</em> operation (also called a <em>fold</em>) takes a sequence
* of input elements and combines them into a single summary result by repeated
* application of a combining operation, such as finding the sum or maximum of
* a set of numbers, or accumulating elements into a list.  The streams classes have
* multiple
 forms of general reduction operations, called
* {@link java.util.stream.Stream#reduce(java.util.function.BinaryOperator) reduce()}
* and {@link java.util.stream.Stream#collect(java.util.stream.Collector) collect()},
* as well as multiple specialized reduction forms such as
* {@link java.util.stream.IntStream#sum() sum()}, {@link java.util.stream.IntStream#max() max()},
* or {@link java.util.stream.IntStream#count() count()}.
*
* <p>Of course, such operations can be readily implemented as simple sequential
* loops, as in:
* <pre>{@code
*    int sum = 0;
*    for (int x : numbers) {
*       sum += x;
*    }
* }</pre>
* However, there are good reasons to prefer a reduce operation
* over a mutative accumulation such as the above.  Not only is a reduction
* "more abstract" -- it operates on the stream as a whole rather than individual
* elements -- but a properly constructed reduce operation is inherently
```

```
* parallelizable, so long as the function(s) used to process the
 elements
* are <a href="package-summary.html#Associativity">associative</a> and
* <a href="package-summary.html#NonInterfering">stateless</a>.
* For example, given a stream of numbers for which we want to find the sum, we
* can write:
* <pre>{@code
*    int sum = numbers.stream().reduce(0, (x,y) -> x+y);
* }</pre>
* or:
* <pre>{@code
*    int sum = numbers.stream().reduce(0, Integer::sum);
* }</pre>
*
* <p>These reduction operations can run safely in parallel with almost no
* modification:
* <pre>{@code
*    int sum = numbers.parallelStream().reduce(0, Integer::sum);
* }</pre>
*
* <p>Reduction parallellizes well because the implementation
* can operate on subsets of the data in parallel, and then combine the
* intermediate results to get the final correct answer.  (Even if the language
* had a "parallel for-each" construct, the mutative accumulation approach would
* still required the developer to provide
* thread-safe updates to the shared accumulating variable
 {@code sum}, and
* the required synchronization would then likely eliminate any performance gain from
* parallelism.)  Using {@code reduce()} instead removes all of the
* burden of parallelizing the reduction operation, and the library can provide
* an efficient parallel implementation with no additional synchronization
* required.
*
* <p>The "widgets" examples shown earlier shows how reduction combines with
* other operations to replace for loops with bulk operations.  If {@code widgets}
* is a collection of {@code Widget} objects, which have a {@code getWeight} method,
* we can find the heaviest widget with:
* <pre>{@code
*     OptionalInt heaviest = widgets.parallelStream()
*                            .mapToInt(Widget::getWeight)
*                            .max();
* }</pre>
*
* <p>In its more general form, a {@code reduce} operation on elements of type
* {@code <T>} yielding a result of type {@code <U>} requires three parameters:
* <pre>{@code
 * <U> U reduce(U identity,
*             BiFunction<U, ? super T, U> accumulator,
```

```
*             BinaryOperator<U> combiner);
* }</pre>
* Here, the <em>identity</em> element is both an initial seed value for the reduction
* and a default result if there are no input elements. The <em>accumulator</em>
* function takes a partial result and the next element, and produces a new
* partial result. The <em>combiner</em> function combines two partial results
* to produce a new partial result.  (The combiner is necessary in parallel
* reductions, where the input is partitioned, a partial accumulation computed
* for each partition, and then the partial results are combined to produce a
* final result.)
*
* <p>More formally, the {@code identity} value must be an <em>identity</em> for
* the combiner function. This means that for all {@code u},
* {@code combiner.apply(identity, u)} is equal to {@code u}. Additionally, the
* {@code combiner} function must be <a href="package-summary.html#Associativity">associative</a>
 and
* must be compatible with the {@code accumulator} function: for all {@code u}
* and {@code t}, {@code combiner.apply(u, accumulator.apply(identity, t))} must
* be {@code equals()} to {@code accumulator.apply(u, t)}.
*
* <p>The three-argument form is a generalization of the two-argument form,
* incorporating a mapping step into the accumulation step.  We could
* re-cast the simple sum-of-weights example using the more general form as
* follows:
* <pre>{@code
*     int sumOfWeights = widgets.stream()
*                         .reduce(0,
*                                 (sum, b) -> sum + b.getWeight())
*                                 Integer::sum);
* }</pre>
* though the explicit map-reduce form is more readable and therefore should
* usually be preferred. The generalized form is provided for cases where
* significant work can be optimized away by combining mapping and reducing
* into a single function.
*
*
 <h3><a name="MutableReduction">Mutable reduction</a></h3>
*
* A <em>mutable reduction operation</em> accumulates input elements into a
* mutable result container, such as a {@code Collection} or {@code StringBuilder},
* as it processes the elements in the stream.
*
* <p>If we wanted to take a stream of strings and concatenate them into a
* single long string, we <em>could</em> achieve this with ordinary reduction:
* <pre>{@code
*     String concatenated = strings.reduce("", String::concat)
* }</pre>
*
```

```
* <p>We would get the desired result, and it would even work in parallel.  However,
* we might not be happy about the performance!  Such an implementation would do
* a great deal of string copying, and the run time would be <em>O(n^2)</em> in
* the number of characters.  A more performant approach would be to accumulate
* the results into a {@link java.lang.StringBuilder}, which is a mutable
* container for accumulating strings.  We can use the same technique to
* parallelize
 mutable reduction as we do with ordinary reduction.
*
* <p>The mutable reduction operation is called
* {@link java.util.stream.Stream#collect(Collector) collect()},
* as it collects together the desired results into a result container such
* as a {@code Collection}.
* A {@code collect} operation requires three functions:
* a supplier function to construct new instances of the result container, an
* accumulator function to incorporate an input element into a result
* container, and a combining function to merge the contents of one result
* container into another.  The form of this is very similar to the general
* form of ordinary reduction:
* <pre>{@code
* <R> R collect(Supplier<R> supplier,
*             BiConsumer<R, ? super T> accumulator,
*             BiConsumer<R, R> combiner);
* }</pre>
* <p>As with {@code reduce()}, a benefit of expressing {@code collect} in this
* abstract way is that it is directly amenable to parallelization: we can
* accumulate
 partial results in parallel and then combine them, so long as the
* accumulation and combining functions satisfy the appropriate requirements.
* For example, to collect the String representations of the elements in a
* stream into an {@code ArrayList}, we could write the obvious sequential
* for-each form:
* <pre>{@code
*     ArrayList<String> strings = new ArrayList<>();
*     for (T element : stream) {
*         strings.add(element.toString());
*     }
* }</pre>
* Or we could use a parallelizable collect form:
* <pre>{@code
*     ArrayList<String> strings = stream.collect(() -> new ArrayList<>(),
*                                                (c, e) -> c.add(e.toString()),
*                                                (c1, c2) -> c1.addAll(c2));
* }</pre>
* or, pulling the mapping operation out of the accumulator function, we could
* express it more succinctly as:
* <pre>{@code
*     List<String> strings = stream.map(Object::toString)
```

```
*
            .collect(ArrayList::new, ArrayList::add, ArrayList::addAll);
* }</pre>
* Here, our supplier is just the {@link java.util.ArrayList#ArrayList()
* ArrayList constructor}, the accumulator adds the stringified element to an
* {@code ArrayList}, and the combiner simply uses {@link java.util.ArrayList#addAll addAll}
* to copy the strings from one container into the other.
*
* <p>The three aspects of {@code collect} -- supplier, accumulator, and
* combiner -- are tightly coupled.  We can use the abstraction of a
* {@link java.util.stream.Collector} to capture all three aspects.  The
* above example for collecting strings into a {@code List} can be rewritten
* using a standard {@code Collector} as:
* <pre>{@code
*     List<String> strings = stream.map(Object::toString)
*                              .collect(Collectors.toList());
* }</pre>
*
* <p>Packaging mutable reductions into a Collector has another advantage:
* composability.  The class {@link java.util.stream.Collectors}
 contains a
* number of predefined factories for collectors, including combinators
* that transform one collector into another.  For example, suppose we have a
* collector that computes the sum of the salaries of a stream of
* employees, as follows:
*
* <pre>{@code
*     Collector<Employee, ?, Integer> summingSalaries
*         = Collectors.summingInt(Employee::getSalary);
* }</pre>
*
* (The {@code ?} for the second type parameter merely indicates that we don't
* care about the intermediate representation used by this collector.)
* If we wanted to create a collector to tabulate the sum of salaries by
* department, we could reuse {@code summingSalaries} using
* {@link java.util.stream.Collectors#groupingBy(java.util.function.Function, java.util.stream.Collector)
groupingBy}:
*
* <pre>{@code
*     Map<Department, Integer> salariesByDept
*         = employees.stream().collect(Collectors.groupingBy(Employee::getDepartment,
*
                              summingSalaries));
* }</pre>
*
* <p>As with the regular reduction operation, {@code collect()} operations can
* only be parallelized if appropriate conditions are met.  For any partially
* accumulated result, combining it with an empty result container must
```

```
* produce an equivalent result.  That is, for a partially accumulated result
* {@code p} that is the result of any series of accumulator and combiner
* invocations, {@code p} must be equivalent to
* {@code combiner.apply(p, supplier.get())}.
*
* <p>Further, however the computation is split, it must produce an equivalent
* result.  For any input elements {@code t1} and {@code t2}, the results
* {@code r1} and {@code r2} in the computation below must be equivalent:
* <pre>{@code
*     A a1 = supplier.get();
*     accumulator.accept(a1, t1);
*     accumulator.accept(a1, t2);
*     R r1 = finisher.apply(a1);  // result without splitting
*
*     A a2 = supplier.get();
*     accumulator.accept(a2,
 t1);
*     A a3 = supplier.get();
*     accumulator.accept(a3, t2);
*     R r2 = finisher.apply(combiner.apply(a2, a3));  // result with splitting
* }</pre>
*
* <p>Here, equivalence generally means according to {@link java.lang.Object#equals(Object)}.
* but in some cases equivalence may be relaxed to account for differences in
* order.
*
* <h3><a name="ConcurrentReduction">Reduction, concurrency, and ordering</a></h3>
*
* With some complex reduction operations, for example a {@code collect()} that
* produces a {@code Map}, such as:
* <pre>{@code
*     Map<Buyer, List<Transaction>> salesByBuyer
*         = txns.parallelStream()
*             .collect(Collectors.groupingBy(Transaction::getBuyer));
* }</pre>
* it may actually be counterproductive to perform the operation in parallel.
* This is because the combining step (merging one {@code Map} into another by
* key) can be expensive for some {@code Map} implementations.
*
* <p>Suppose, however, that the
 result container used in this reduction
* was a concurrently modifiable collection -- such as a
* {@link java.util.concurrent.ConcurrentHashMap}. In that case, the parallel
* invocations of the accumulator could actually deposit their results
* concurrently into the same shared result container, eliminating the need for
* the combiner to merge distinct result containers. This potentially provides
* a boost to the parallel execution performance. We call this a
* <em>concurrent</em> reduction.
```

```
*
* <p>A {@link java.util.stream.Collector} that supports concurrent reduction is
* marked with the {@link java.util.stream.Collector.Characteristics#CONCURRENT}
* characteristic.  However, a concurrent collection also has a downside.  If
* multiple threads are depositing results concurrently into a shared container,
* the order in which results are deposited is non-deterministic. Consequently,
* a concurrent reduction is only possible if ordering is not important for the
* stream
 being processed. The {@link java.util.stream.Stream#collect(Collector)}
* implementation will only perform a concurrent reduction if
* <ul>
* <li>The stream is parallel;</li>
* <li>The collector has the
* {@link java.util.stream.Collector.Characteristics#CONCURRENT} characteristic,
* and;</li>
* <li>Either the stream is unordered, or the collector has the
* {@link java.util.stream.Collector.Characteristics#UNORDERED} characteristic.
* </ul>
* You can ensure the stream is unordered by using the
* {@link java.util.stream.BaseStream#unordered()} method.  For example:
* <pre>{@code
*     Map<Buyer, List<Transaction>> salesByBuyer
*         = txns.parallelStream()
*             .unordered()
*             .collect(groupingByConcurrent(Transaction::getBuyer));
* }</pre>
* (where {@link java.util.stream.Collectors#groupingByConcurrent} is the
* concurrent equivalent of {@code groupingBy}).
*
* <p>Note that if it is important that the elements for a given key appear in
 * the order they appear in the source, then we cannot use a concurrent
* reduction, as ordering is one of the casualties of concurrent insertion.
* We would then be constrained to implement either a sequential reduction or
* a merge-based parallel reduction.
*
* <h3><a name="Associativity">Associativity</a></h3>
*
* An operator or function {@code op} is <em>associative</em> if the following
* holds:
* <pre>{@code
*     (a op b) op c == a op (b op c)
* }</pre>
* The importance of this to parallel evaluation can be seen if we expand this
* to four terms:
* <pre>{@code
*     a op b op c op d == (a op b) op (c op d)
* }</pre>
* So we can evaluate {@code (a op b)} in parallel with {@code (c op d)}, and
```

```
* then invoke {@code op} on the results.
*
* <p>Examples of associative operations include numeric addition, min, and
* max, and string concatenation.
*
* <h2><a name="StreamSources">Low-level stream construction</a></h2>
*
* So far, all the stream examples have used
 methods like
* {@link java.util.Collection#stream()} or {@link java.util.Arrays#stream(Object[])}
* to obtain a stream.  How are those stream-bearing methods implemented?
*
* <p>The class {@link java.util.stream.StreamSupport} has a number of
* low-level methods for creating a stream, all using some form of a
* {@link java.util.Spliterator}. A spliterator is the parallel analogue of an
* {@link java.util.Iterator}; it describes a (possibly infinite) collection of
* elements, with support for sequentially advancing, bulk traversal, and
* splitting off some portion of the input into another spliterator which can
* be processed in parallel.  At the lowest level, all streams are driven by a
* spliterator.
*
* <p>There are a number of implementation choices in implementing a
* spliterator, nearly all of which are tradeoffs between simplicity of
* implementation and runtime performance of streams using that spliterator.
* The simplest, but least performant, way to create a spliterator
 is to
* create one from an iterator using
* {@link java.util.Spliterators#spliteratorUnknownSize(java.util.Iterator, int)}.
* While such a spliterator will work, it will likely offer poor parallel
* performance, since we have lost sizing information (how big is the
* underlying data set), as well as being constrained to a simplistic
* splitting algorithm.
*
* <p>A higher-quality spliterator will provide balanced and known-size
* splits, accurate sizing information, and a number of other
* {@link java.util.Spliterator#characteristics() characteristics} of the
* spliterator or data that can be used by implementations to optimize
* execution.
*
* <p>Spliterators for mutable data sources have an additional challenge;
* timing of binding to the data, since the data could change between the time
* the spliterator is created and the time the stream pipeline is executed.
* Ideally, a spliterator for a stream would report a characteristic of

* {@code IMMUTABLE} or
 {@code CONCURRENT}; if not it should be
* <a href="../Spliterator.html#binding"><em>late-binding</em></a>. If a source
* cannot directly supply a recommended spliterator, it may indirectly supply
```

```
* a spliterator using a {@code Supplier}, and construct a stream via the
* {@code Supplier}-accepting versions of
* {@link java.util.stream.StreamSupport#stream(Supplier, int, boolean) stream()}.
* The spliterator is obtained from the supplier only after the terminal
* operation of the stream pipeline commences.
*
* <p>These requirements significantly reduce the scope of potential
* interference between mutations of the stream source and execution of stream
* pipelines. Streams based on spliterators with the desired characteristics,
* or those using the Supplier-based factory forms, are immune to
* modifications of the data source prior to commencement of the terminal
* operation (provided the behavioral parameters to the stream operations meet
* the required criteria for non-interference
 and statelessness).  See
* <a href="package-summary.html#NonInterference">Non-Interference</a>
* for more details.
*

   */
/** Warn about using proprietary API.
   *  @param pos        Position to be used for error reporting.
   *  @param msg        A string describing the problem.
```

```
    */
/** Validate a type expression. That is,
    *  check that all type arguments of a parametric type are within
    *  their bounds.
 This must be done in a second phase after type attribution
    *  since a class might have a subclass as type parameter bound. E.g:
    *
    *  <pre>{@code
    *  class B<A extends C> { ... }
    *  class C extends B<C> { ... }
    *  }</pre>
    *
    *  and we can't make sure that the bound is already attributed because
    *  of possible cycles.
    *
    * Visitor method: Validate a type expression, if it is not null, catching
    *  and reporting any completion failures.
    */

*/
/**
* Provide an optional convenience implementation of Locator.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class is available mainly for application writers, who
* can use it to make a persistent snapshot of a locator at any
* point during a document parse:</p>
*
* <pre>
* Locator locator;
* Locator startloc;
*
* public void setLocator (Locator locator)
* {
*        // note the locator
*   this.locator = locator;
* }
*
* public void startDocument ()
* {
 *        // save the location of the start of the document
*        // for future use.
*   Locator startloc = new LocatorImpl(locator);
* }
*</pre>
*
```

```
* <p>Normally, parser writers will not use this class, since it
* is more efficient to provide location information only when
* requested, rather than constantly updating a Locator object.</p>
*
* @since SAX 1.0
* @author David Megginson
* @see org.xml.sax.Locator Locator
*/

*/
/** Helper class for name resolution, used mostly by the attribution phase.
*
*  <p><b>This is NOT part of any supported API.
*  If you write code that depends on this, you do so at your own risk.
*  This code and its internal interfaces are subject to change or
*  deletion without notice.</b>
*/
/**
    * Performs a recursive scan of a type looking for accessibility problems
    * from current attribution environment
    */
/**
    * Main method applicability routine. Given a list of actual types A,
    * a list of formal types F, determines whether the types in A are
    * compatible (by method invocation conversion) with the types in F.
    *
    * Since this routine is shared between overload
 resolution and method
    * type-inference, a (possibly empty) inference context is used to convert
    * formal types to the corresponding 'undet' form ahead of a compatibility
    * check so that constraints can be propagated and collected.
```

```
    *
    * Moreover, if one or more types in A is a deferred type, this routine uses
    * DeferredAttr in order to perform deferred attribution. If one or more actual
    * deferred types are stuck, they are placed in a queue and revisited later
    * after the remainder of the arguments have been seen. If this is not sufficient
    * to 'unstuck' the argument, a cyclic inference error is called out.
    *
    * A method check handler (see above) is used in order to report errors.
    */
/** Find or create an implicit method of exactly the given type (after erasure).
    *  Searches in a side table, not the main scope of the site.
    *  This emulates the lookup process required by JSR 292 in JVM.
    *  @param env       Attribution
 environment
    *  @param spMethod  signature polymorphic method - i.e. MH.invokeExact
    *  @param argtypes  The required argument types
    */
/** Resolve constructor using diamond inference.
    *  @param pos       The position to use for error reporting.
    *  @param env       The environment current at the constructor invocation.
    *  @param site      The type of class for which a constructor is searched.
    *                   The scope of this class has been touched in attribution.
    *  @param argtypes  The types of the constructor invocation's value
    *                   arguments.
    *  @param typeargtypes  The types of the constructor invocation's type
    *                   arguments.
    */
/**
        * Create an external representation for this erroneous symbol to be
        * used during attribution - by default this returns the symbol of a
        * brand new error type which stores the original type found
        * during resolution.

        *
        * @param name     the name used during resolution
        * @param location the location from which the symbol is accessed
        */

*******************************************************************************
 */
/**
* <code>Replaceable</code> is an interface representing a
* string of characters that supports the replacement of a range of
* itself with a new string of characters.  It is used by APIs that
* change a piece of text while retaining metadata.  Metadata is data
* other than the Unicode characters returned by char32At().  One
* example of metadata is style attributes; another is an edit
* history, marking each character with an author and revision number.
*
* <p>An implicit aspect of the <code>Replaceable</code> API is that
* during a replace operation, new characters take on the metadata of
* the old characters.  For example, if the string "the <b>bold</b>
* font" has range (4, 8) replaced with "strong", then it becomes "the
* <b>strong</b> font".
*
* <p><code>Replaceable</code> specifies ranges using a start
* offset and a limit offset.  The range of characters thus specified
```

```
* includes the characters at offset start..limit-1.  That is, the
* start offset
 is inclusive, and the limit offset is exclusive.
*
* <p><code>Replaceable</code> also includes API to access characters
* in the string: <code>length()</code>, <code>charAt()</code>,
* <code>char32At()</code>, and <code>extractBetween()</code>.
*
* <p>For a subclass to support metadata, typical behavior of
* <code>replace()</code> is the following:
* <ul>
*   <li>Set the metadata of the new text to the metadata of the first
*   character replaced</li>
*   <li>If no characters are replaced, use the metadata of the
*   previous character</li>
*   <li>If there is no previous character (i.e. start == 0), use the
*   following character</li>
*   <li>If there is no following character (i.e. the replaceable was
*   empty), use default metadata<br>
*   <li>If the code point U+FFFF is seen, it should be interpreted as
*   a special marker having no metadata<li>
*   </li>
* </ul>
* If this is not the behavior, the subclass should document any differences.
*

// NO WARRANTY!  This class is in the public domain.
/**
* Receive notification of the logical content of a document.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This is the main interface that most SAX applications
* implement: if the application needs to be informed of basic parsing
* events, it implements this interface and registers an instance with
* the SAX parser using the {@link org.xml.sax.XMLReader#setContentHandler
* setContentHandler} method.  The parser uses
 the instance to report
* basic document-related events like the start and end of elements
* and character data.</p>
*
* <p>The order of events in this interface is very important, and
* mirrors the order of information in the document itself.  For
* example, all of an element's content (character data, processing
* instructions, and/or subelements) will appear, in order, between
* the startElement event and the corresponding endElement event.</p>
*
* <p>This interface is similar to the now-deprecated SAX 1.0
* DocumentHandler interface, but it adds support for Namespaces
* and for reporting skipped entities (in non-validating XML
* processors).</p>
*
* <p>Implementors should note that there is also a
* <code>ContentHandler</code> class in the <code>java.net</code>
```

```
* package; that means that it's probably a bad idea to do</p>
*
* <pre>import java.net.*;
* import org.xml.sax.*;
* </pre>
*
* <p>In fact, "import ...*" is usually a sign of sloppy programming
* anyway,
 so the user should consider this a feature rather than a
* bug.</p>
*
* @since SAX 2.0
* @author David Megginson
* @see org.xml.sax.XMLReader
* @see org.xml.sax.DTDHandler
* @see org.xml.sax.ErrorHandler

*/
// NO WARRANTY!  This class is in the public domain.
/**
* Default implementation of the Attributes interface.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class provides a default implementation of the SAX2
* {@link org.xml.sax.Attributes Attributes} interface, with the
* addition of manipulators so that the list can be modified or
* reused.</p>
*
* <p>There are two typical uses of this class:</p>
```

```
*
* <ol>
* <li>to take a persistent snapshot of an Attributes object
 *  in a {@link org.xml.sax.ContentHandler#startElement startElement} event; or</li>
* <li>to construct or modify an Attributes object in a SAX2 driver or filter.</li>
* </ol>
*
* <p>This class replaces the now-deprecated SAX1 {@link
* org.xml.sax.helpers.AttributeListImpl AttributeListImpl}
* class; in addition to supporting the updated Attributes
* interface rather than the deprecated {@link org.xml.sax.AttributeList
* AttributeList} interface, it also includes a much more efficient
* implementation using a single array rather than a set of Vectors.</p>
*
* @since JAXB1.0
* @since SAX 2.0
* @author David Megginson
* @version 2.0.1 (sax2r2)

*/
/**
* Basic interface for resolving entities.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
```

```
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>If a SAX application needs to implement customized handling
* for external entities, it must implement this interface and
* register an instance with the SAX driver using the
* {@link org.xml.sax.XMLReader#setEntityResolver setEntityResolver}
* method.</p>
*
* <p>The XML reader will then allow the application to intercept any
* external entities (including the external DTD subset
 and external
* parameter entities, if any) before including them.</p>
*
* <p>Many SAX applications will not need to implement this interface,
* but it will be especially useful for applications that build
* XML documents from databases or other specialised input sources,
* or for applications that use URI types other than URLs.</p>
*
* <p>The following resolver would provide the application
* with a special character stream for the entity with the system
* identifier "http://www.myhost.com/today":</p>
*
* <pre>
* import org.xml.sax.EntityResolver;
* import org.xml.sax.InputSource;
*
* public class MyResolver implements EntityResolver {
*   public InputSource resolveEntity (String publicId, String systemId)
*   {
*     if (systemId.equals("http://www.myhost.com/today")) {
*             // return a special input source
*       MyReader reader = new MyReader();
*       return new InputSource(reader);
*     } else {
*             // use the default behaviour
*
    return null;
*     }
*   }
* }
* </pre>
*
* <p>The application can also use this interface to redirect system
* identifiers to local URIs or to look up replacements in a catalog
* (possibly by using the public identifier).</p>
```

```
*
* @since SAX 1.0
* @author David Megginson
* @see org.xml.sax.XMLReader#setEntityResolver
* @see org.xml.sax.InputSource
*/

*/
/**
* This class is for AWT permissions.
* An <code>AWTPermission</code> contains a target name but
* no actions list; you either have the named permission
* or you don't.
*
* <P>
* The target name is the name of the AWT permission (see below). The naming
* convention follows the hierarchical property naming convention.
* Also, an asterisk could be used to represent all AWT permissions.
*
* <P>
* The following table lists all the possible <code>AWTPermission</code>
* target names, and for each provides a description of what the
* permission allows and a discussion of the risks of granting code
* the permission.
*
* <table border=1 cellpadding=5 summary="AWTPermission target names, descriptions,
```

```
 and associated risks.">
* <tr>
* <th>Permission Target Name</th>
* <th>What the Permission Allows</th>
* <th>Risks of Allowing this Permission</th>
* </tr>
*
* <tr>
*   <td>accessClipboard</td>
*   <td>Posting and retrieval of information to and from the AWT clipboard</td>
*   <td>This would allow malfeasant code to share
* potentially sensitive or confidential information.</td>
* </tr>
*
* <tr>
*   <td>accessEventQueue</td>
*   <td>Access to the AWT event queue</td>
*   <td>After retrieving the AWT event queue,
* malicious code may peek at and even remove existing events
* from its event queue, as well as post bogus events which may purposefully
* cause the application or applet to misbehave in an insecure manner.</td>
* </tr>
*
* <tr>
*   <td>accessSystemTray</td>
*   <td>Access to the AWT SystemTray instance</td>
*   <td>This would allow malicious code to add tray icons to the system tray.
* First, such an icon may look like the icon of some known application
 * (such as a firewall or anti-virus) and order a user to do something unsafe
* (with help of balloon messages). Second, the system tray may be glutted with
* tray icons so that no one could add a tray icon anymore.</td>
* </tr>
*
* <tr>
*   <td>createRobot</td>
*   <td>Create java.awt.Robot objects</td>
*   <td>The java.awt.Robot object allows code to generate native-level
* mouse and keyboard events as well as read the screen. It could allow
* malicious code to control the system, run other programs, read the
* display, and deny mouse and keyboard access to the user.</td>
* </tr>
*
* <tr>
*   <td>fullScreenExclusive</td>
*   <td>Enter full-screen exclusive mode</td>
*   <td>Entering full-screen exclusive mode allows direct access to
* low-level graphics card memory.  This could be used to spoof the
* system, since the program is in direct control of rendering. Depending on
```

```
* the implementation, the security warning may not be shown for the windows
* used
 to enter the full-screen exclusive mode (assuming that the {@code
* fullScreenExclusive} permission has been granted to this application). Note
* that this behavior does not mean that the {@code
* showWindowWithoutWarningBanner} permission will be automatically granted to
* the application which has the {@code fullScreenExclusive} permission:
* non-full-screen windows will continue to be shown with the security
* warning.</td>
* </tr>
*
* <tr>
*   <td>listenToAllAWTEvents</td>
*   <td>Listen to all AWT events, system-wide</td>
*   <td>After adding an AWT event listener,
* malicious code may scan all AWT events dispatched in the system,
* allowing it to read all user input (such as passwords).  Each
* AWT event listener is called from within the context of that
* event queue's EventDispatchThread, so if the accessEventQueue
* permission is also enabled, malicious code could modify the
* contents of AWT event queues system-wide, causing the application
* or applet to misbehave
 in an insecure manner.</td>
* </tr>
*
* <tr>
*   <td>readDisplayPixels</td>
*   <td>Readback of pixels from the display screen</td>
*   <td>Interfaces such as the java.awt.Composite interface or the
* java.awt.Robot class allow arbitrary code to examine pixels on the
* display enable malicious code to snoop on the activities of the user.</td>
* </tr>
*
* <tr>
*   <td>replaceKeyboardFocusManager</td>
*   <td>Sets the <code>KeyboardFocusManager</code> for
*       a particular thread.
*   <td>When <code>SecurityManager</code> is installed, the invoking
*       thread must be granted this permission in order to replace
*       the current <code>KeyboardFocusManager</code>.  If permission
*       is not granted, a <code>SecurityException</code> will be thrown.
* </tr>
*
* <tr>
*   <td>setAppletStub</td>
*   <td>Setting the stub which implements Applet container services</td>
*   <td>Malicious code could set an applet's stub and result in unexpected
* behavior
```

```
 or denial of service to an applet.</td>
* </tr>
*
* <tr>
*   <td>setWindowAlwaysOnTop</td>
*   <td>Setting always-on-top property of the window: {@link Window#setAlwaysOnTop}</td>
*   <td>The malicious window might make itself look and behave like a real full desktop, so that
* information entered by the unsuspecting user is captured and subsequently misused </td>
* </tr>
*
* <tr>
*   <td>showWindowWithoutWarningBanner</td>
*   <td>Display of a window without also displaying a banner warning
* that the window was created by an applet</td>
*   <td>Without this warning,
* an applet may pop up windows without the user knowing that they
* belong to an applet.  Since users may make security-sensitive
* decisions based on whether or not the window belongs to an applet
* (entering a username and password into a dialog box, for example),
* disabling this warning banner may allow applets to trick the user
* into entering such information.</td>
* </tr>
*
* <tr>
*   <td>toolkitModality</td>
 *   <td>Creating {@link Dialog.ModalityType#TOOLKIT_MODAL TOOLKIT_MODAL} dialogs
*       and setting the {@link Dialog.ModalExclusionType#TOOLKIT_EXCLUDE
*       TOOLKIT_EXCLUDE} window property.</td>
*   <td>When a toolkit-modal dialog is shown from an applet, it blocks all other
* applets in the browser. When launching applications from Java Web Start,
* its windows (such as the security dialog) may also be blocked by toolkit-modal
* dialogs, shown from these applications.</td>
* </tr>
*
* <tr>
*   <td>watchMousePointer</td>
*   <td>Getting the information about the mouse pointer position at any
* time</td>
*   <td>Constantly watching the mouse pointer,
* an applet can make guesses about what the user is doing, i.e. moving
* the mouse to the lower left corner of the screen most likely means that
* the user is about to launch an application. If a virtual keypad is used
* so that keyboard is emulated using the mouse, an applet may guess what
* is
 being typed.</td>
* </tr>
* </table>
*

*/
// NO WARRANTY! This class is in the public domain.
/**
* Default implementation of the Attributes interface.
*
* <blockquote>
* This module, both source code and documentation, is in the
* Public Domain, and comes with NO WARRANTY.
* </blockquote>
*
* <p>This class provides a default implementation of the SAX2
* {@link org.xml.sax.Attributes Attributes} interface, with the
* addition of manipulators so that the list can be modified or

```
* reused.</p>
*
* <p>There are two typical uses of this class:</p>
*
* <ol>
* <li>to take a persistent snapshot of an Attributes object
*  in a {@link org.xml.sax.ContentHandler#startElement startElement} event; or</li>
* <li>to construct
 or modify an Attributes object in a SAX2 driver or filter.</li>
* </ol>
*
* <p>This class replaces the now-deprecated SAX1 {@link
* org.xml.sax.helpers.AttributeListImpl AttributeListImpl}
* class; in addition to supporting the updated Attributes
* interface rather than the deprecated {@link org.xml.sax.AttributeList
* AttributeList} interface, it also includes a much more efficient
* implementation using a single array rather than a set of Vectors.</p>
*
* <p><b>
*     Auto-generated, do not edit.
* </b></p>
* @since SAX 2.0
* @author David Megginson,
*        <a href="mailto:sax@megginson.com">sax@megginson.com</a>
* @version 2.0

*/
/**
* This class is for Serializable permissions. A SerializablePermission
* contains a name (also referred to as a "target name") but
* no actions list; you either have the named permission
* or you don't.
*
* <P>
* The target name is the name of the Serializable permission (see below).
*
* <P>
* The following table lists all the possible SerializablePermission target names,
* and for each provides a description of what the permission allows
* and a discussion of the risks of granting code the permission.
*
* <table border=1 cellpadding=5 summary="Permission target name, what the permission allows, and associated
risks">
* <tr>
* <th>Permission Target Name</th>
* <th>What the Permission Allows</th>
 * <th>Risks of Allowing this Permission</th>
* </tr>
*
* <tr>
*   <td>enableSubclassImplementation</td>
*   <td>Subclass implementation of ObjectOutputStream or ObjectInputStream
* to override the default serialization or deserialization, respectively,
* of objects</td>
*   <td>Code can use this to serialize or
* deserialize classes in a purposefully malfeasant manner. For example,
* during serialization, malicious code can use this to
* purposefully store confidential private field data in a way easily accessible
```

```
* to attackers. Or, during deserialization it could, for example, deserialize
* a class with all its private fields zeroed out.</td>
* </tr>
*
* <tr>
*   <td>enableSubstitution</td>
*   <td>Substitution of one object for another during
* serialization or deserialization</td>
*   <td>This is dangerous because malicious code
* can replace the actual object with one which has incorrect or
* malignant data.</td>
* </tr>
*
* </table>
*

/**
    * Create
 a new <code>LSParser</code>. The newly constructed parser may
    * then be configured by means of its <code>DOMConfiguration</code>
    * object, and used to parse documents by means of its <code>parse</code>
    *  method.
    * @param mode  The <code>mode</code> argument is either
    *   <code>MODE_SYNCHRONOUS</code> or <code>MODE_ASYNCHRONOUS</code>, if
    *   <code>mode</code> is <code>MODE_SYNCHRONOUS</code> then the
    *   <code>LSParser</code> that is created will operate in synchronous
    *   mode, if it's <code>MODE_ASYNCHRONOUS</code> then the
    *   <code>LSParser</code> that is created will operate in asynchronous
    *   mode.
    * @param schemaType  An absolute URI representing the type of the schema
    *   language used during the load of a <code>Document</code> using the
```

```
    *   newly created <code>LSParser</code>. Note that no lexical checking
    *   is done on the absolute URI. In order to create a
    *   <code>LSParser</code> for any kind of
 schema types (i.e. the
    *   LSParser will be free to use any schema found), use the value
    *   <code>null</code>.
    * <p ><b>Note:</b>    For W3C XML Schema [<a href='http://www.w3.org/TR/2001/REC-xmlschema-1-
20010502/'>XML Schema Part 1</a>]
    *   , applications must use the value
    *   <code>"http://www.w3.org/2001/XMLSchema"</code>. For XML DTD [<a
href='http://www.w3.org/TR/2004/REC-xml-20040204'>XML 1.0</a>],
    *   applications must use the value
    *   <code>"http://www.w3.org/TR/REC-xml"</code>. Other Schema languages
    *   are outside the scope of the W3C and therefore should recommend an
    *   absolute URI in order to use this method.
    * @return  The newly created <code>LSParser</code> object. This
    *   <code>LSParser</code> is either synchronous or asynchronous
    *   depending on the value of the <code>mode</code> argument.
    * <p ><b>Note:</b>    By default, the newly created <code>LSParser</code>
    *   does not contain a <code>DOMErrorHandler</code>,
 i.e. the value of
    *   the "<a href='http://www.w3.org/TR/DOM-Level-3-Core/core.html#parameter-error-handler'>
    *   error-handler</a>" configuration parameter is <code>null</code>. However, implementations
    *   may provide a default error handler at creation time. In that case,
    *   the initial value of the <code>"error-handler"</code> configuration
    *   parameter on the new <code>LSParser</code> object contains a
    *   reference to the default error handler.
    * @exception DOMException
    *    NOT_SUPPORTED_ERR: Raised if the requested mode or schema type is
    *   not supported.
    */

/**
* The XMLStreamWriter interface specifies how to write XML.  The XMLStreamWriter  does
* not perform well formedness checking on its input.  However
* the writeCharacters method is required to escape &amp; , &lt; and &gt;
* For attribute values the writeAttribute method will escape the
* above characters plus &quot; to ensure that all character content
* and attribute values are well formed.
*
* Each NAMESPACE
* and ATTRIBUTE must be individually written.
*
* <table border="1" cellpadding="2" cellspacing="0">

*/
/**
   * Returns an <code>Iterator</code> over all the immediate child
   * {@link Node}s of this element. This includes <code>javax.xml.soap.Text</code>
   * objects as well as <code>SOAPElement</code> objects.
   * <p>
   * Calling this method may cause child <code>Element</code>,
   * <code>SOAPElement</code> and <code>org.w3c.dom.Text</code> nodes to be
   * replaced by <code>SOAPElement</code>, <code>SOAPHeaderElement</code>,
   * <code>SOAPBodyElement</code> or <code>javax.xml.soap.Text</code> nodes as
   * appropriate for the type of this parent node. As a result the calling
   * application must treat any existing references to these child nodes that
```

```
   * have been obtained through
 DOM APIs as invalid and either discard them or
   * refresh them with the values returned by this <code>Iterator</code>. This
   * behavior can be avoided by calling the equivalent DOM APIs. See
   * {@link <a HREF="package-summary.html#package_description">javax.xml.soap<a>}
   * for more details.
   *
   * @return an iterator with the content of this <code>SOAPElement</code>
   *        object
   */

/**
* The Permission class for reflective operations.
* <P>
* The following table
* provides a summary description of what the permission allows,

```
* and discusses the risks of granting code the permission.
*
* <table border=1 cellpadding=5 summary="Table shows permission target name, what the permission allows, and
associated risks">
* <tr>
* <th>Permission Target Name</th>
* <th>What the Permission Allows</th>
* <th>Risks of Allowing this Permission</th>
* </tr>
*
* <tr>
*   <td>suppressAccessChecks</td>
*   <td>ability to suppress the standard Java language access checks
*       on fields and methods in a class; allow access not only public members
*       but also allow access to default
 (package) access, protected,
*       and private members.</td>
*   <td>This is dangerous in that information (possibly confidential) and
*       methods normally unavailable would be accessible to malicious code.</td>
* </tr>
* <tr>
*   <td>newProxyInPackage.{package name}</td>
*   <td>ability to create a proxy instance in the specified package of which
*       the non-public interface that the proxy class implements.</td>
*   <td>This gives code access to classes in packages to which it normally
*       does not have access and the dynamic proxy class is in the system
*       protection domain. Malicious code may use these classes to
*       help in its attempt to compromise security in the system.</td>

/**
* Basic interface for SAX error handlers.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>If a SAX application needs to implement customized error
* handling, it must implement this interface and then register an
* instance with the XML reader using the
* {@link org.xml.sax.XMLReader#setErrorHandler setErrorHandler}
* method.  The parser will then report all errors and warnings
* through this interface.</p>
*
* <p><strong>WARNING:</strong> If an application does <em>not</em>
 * register an ErrorHandler, XML parsing errors will go unreported,
* except that <em>SAXParseException</em>s will be thrown for fatal errors.
* In order to detect validity errors, an ErrorHandler that does something
* with {@link #error error()} calls must be registered.</p>
*
* <p>For XML processing errors, a SAX driver must use this interface
* in preference to throwing an exception: it is up to the application
* to decide whether to throw an exception for different types of
* errors and warnings.  Note, however, that there is no requirement that
```

* the parser continue to report additional errors after a call to
* {@link #fatalError fatalError}. In other words, a SAX driver class
* may throw an exception after reporting any fatalError.
* Also parsers may throw appropriate exceptions for non-XML errors.
* For example, {@link XMLReader#parse XMLReader.parse()} would throw
* an IOException for errors accessing entities or the document.</p>
*
* @since SAX 1.0
* @author
 David Megginson
* @see org.xml.sax.XMLReader#setErrorHandler
* @see org.xml.sax.SAXParseException

*/
// NO WARRANTY!  This class is in the public domain.
/**
* Receive notification of the logical content of a document.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This is the main interface that most SAX applications
* implement: if the application needs to be informed of basic parsing
* events, it implements this interface and registers an instance with
* the SAX parser using the {@link org.xml.sax.XMLReader#setContentHandler
* setContentHandler} method.  The parser uses
 the instance to report
* basic document-related events like the start and end of elements
* and character data.</p>
*
* <p>The order of events in this interface is very important, and
* mirrors the order of information in the document itself.  For
* example, all of an element's content (character data, processing
* instructions, and/or subelements) will appear, in order, between
* the startElement event and the corresponding endElement event.</p>
*
* <p>This interface is similar to the now-deprecated SAX 1.0
```

```
* DocumentHandler interface, but it adds support for Namespaces
* and for reporting skipped entities (in non-validating XML
* processors).</p>
*
* <p>Implementors should note that there is also a
* <code>ContentHandler</code> class in the <code>java.net</code>
* package; that means that it's probably a bad idea to do</p>
*
* <pre>import java.net.*;
* import org.xml.sax.*;
* </pre>
*
* <p>In fact, "import ...*" is usually a sign of sloppy programming
* anyway,
 so the user should consider this a feature rather than a
* bug.</p>
*
* @since SAX 2.0
* @author David Megginson
* @see org.xml.sax.XMLReader
* @see org.xml.sax.DTDHandler
* @see org.xml.sax.ErrorHandler

*/
/**
* Default base class for handlers.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class implements the default behaviour for four SAX1
* interfaces: EntityResolver, DTDHandler, DocumentHandler,
* and ErrorHandler.  It is now obsolete, but is included in SAX2 to
* support legacy SAX1 applications.  SAX2 applications should use
* the {@link org.xml.sax.helpers.DefaultHandler DefaultHandler}
* class instead.</p>
*
* <p>Application writers can extend this class when
```

```
 they need to
* implement only part of an interface; parser writers can
* instantiate this class to provide default handlers when the
* application has not supplied its own.</p>
*
* <p>Note that the use of this class is optional.</p>
*
* @deprecated This class works with the deprecated
*            {@link org.xml.sax.DocumentHandler DocumentHandler}
*            interface.  It has been replaced by the SAX2
*            {@link org.xml.sax.helpers.DefaultHandler DefaultHandler}
*            class.
* @since SAX 1.0
* @author David Megginson
* @see org.xml.sax.EntityResolver
* @see org.xml.sax.DTDHandler
* @see org.xml.sax.DocumentHandler
* @see org.xml.sax.ErrorHandler

*/
/**
* This class encapsulates the concept of caller-provided channel
* binding information. Channel bindings are used to strengthen the
* quality with which peer entity authentication is provided during
* context establishment.  They enable the GSS-API callers to bind the
* establishment of the security context to relevant characteristics
* like addresses or to application specific data.<p>
*
* The caller initiating the security context must determine the
* appropriate channel binding values to set in the GSSContext object.
* The acceptor must provide an identical binding in order to validate
* that received tokens possess correct channel-related characteristics.<p>
*
* Use of channel bindings is
 optional in GSS-API. ChannelBinding can be
* set for the {@link GSSContext GSSContext} using the {@link
* GSSContext#setChannelBinding(ChannelBinding) setChannelBinding} method
* before the first call to {@link GSSContext#initSecContext(byte[], int, int)
* initSecContext} or {@link GSSContext#acceptSecContext(byte[], int, int)
* acceptSecContext} has been performed.  Unless the <code>setChannelBinding</code>
* method has been used to set the ChannelBinding for a GSSContext object,
* <code>null</code> ChannelBinding will be assumed. <p>
*
* Conceptually, the GSS-API concatenates the initiator and acceptor
* address information, and the application supplied byte array to form an
* octet string.  The mechanism calculates a MIC over this octet string and
* binds the MIC to the context establishment token emitted by
```

```
* <code>initSecContext</code> method of the <code>GSSContext</code>
* interface.  The same bindings are set by the context acceptor for its
* <code>GSSContext</code>
 object and during processing of the
* <code>acceptSecContext</code> method a MIC is calculated in the same
* way. The calculated MIC is compared with that found in the token, and if
* the MICs differ, accept will throw a <code>GSSException</code> with the
* major code set to {@link GSSException#BAD_BINDINGS BAD_BINDINGS}, and
* the context will not be established. Some mechanisms may include the
* actual channel binding data in the token (rather than just a MIC);
* applications should therefore not use confidential data as
* channel-binding components.<p>
*
*  Individual mechanisms may impose additional constraints on addresses
*  that may appear in channel bindings.  For example, a mechanism may
*  verify that the initiator address field of the channel binding
*  contains the correct network address of the host system.  Portable
*  applications should therefore ensure that they either provide correct
*  information for the address fields, or omit setting of the addressing
 *  information.
*

*/
// NO WARRANTY!  This class is in the public domain.
/**
* Interface for a list of XML attributes.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This interface allows access to a list of attributes in
* three different ways:</p>
*
* <ol>
* <li>by attribute index;</li>
* <li>by Namespace-qualified name; or</li>
* <li>by qualified (prefixed) name.</li>
* </ol>
*
* <p>The list will not contain attributes that were declared
* #IMPLIED but not specified in the start tag.
 It will also not
* contain attributes used as Namespace declarations (xmlns*) unless
* the <code>http://xml.org/sax/features/namespace-prefixes</code>
* feature is set to <var>true</var> (it is <var>false</var> by
* default).
* Because SAX2 conforms to the original "Namespaces in XML"
* recommendation, it normally does not
* give namespace declaration attributes a namespace URI.
* </p>
*
* <p>Some SAX2 parsers may support using an optional feature flag
* (<code>http://xml.org/sax/features/xmlns-uris</code>) to request
* that those attributes be given URIs, conforming to a later
* backwards-incompatible revision of that recommendation.  (The
* attribute's "local name" will be the prefix, or "xmlns" when
* defining a default element namespace.)  For portability, handler
* code should always resolve that conflict, rather than requiring
* parsers that can change the setting of that feature flag.  </p>
*
```

```
* <p>If the namespace-prefixes feature (see above) is
* <var>false</var>,
 access by qualified name may not be available; if
* the <code>http://xml.org/sax/features/namespaces</code> feature is
* <var>false</var>, access by Namespace-qualified names may not be
* available.</p>
*
* <p>This interface replaces the now-deprecated SAX1 {@link
* org.xml.sax.AttributeList AttributeList} interface, which does not
* contain Namespace support.  In addition to Namespace support, it
* adds the <var>getIndex</var> methods (below).</p>
*
* <p>The order of attributes in the list is unspecified, and will
* vary from implementation to implementation.</p>
*
* @since SAX 2.0

/**
    * Returns a name for the given time zone ID that's suitable for
    * presentation to the user in the specified locale. The given time
```

```
   * zone ID is "GMT" or one of the names defined using "Zone" entries
   * in the "tz database", a public domain time zone database at
   * <a href="ftp://elsie.nci.nih.gov/pub/">ftp://elsie.nci.nih.gov/pub/</a>.
   * The data of this database is contained in a file whose name starts with
   * "tzdata", and the specification of the data format is part of the zic.8
   * man page, which is contained in a file whose name starts with "tzcode".
   * <p>
   * If <code>daylight</code> is true, the method should return a name
   * appropriate for daylight
 saving time even if the specified time zone
   * has not observed daylight saving time in the past.
   *
   * @param ID a time zone ID string
   * @param daylight if true, return the daylight saving name.
   * @param style either {@link java.util.TimeZone#LONG TimeZone.LONG} or
   *    {@link java.util.TimeZone#SHORT TimeZone.SHORT}
   * @param locale the desired locale
   * @return the human-readable name of the given time zone in the
   *     given locale, or null if it's not available.
   * @exception IllegalArgumentException if <code>style</code> is invalid,
   *     or <code>locale</code> isn't one of the locales returned from
   *     {@link java.util.spi.LocaleServiceProvider#getAvailableLocales()
   *     getAvailableLocales()}.
   * @exception NullPointerException if <code>ID</code> or <code>locale</code>
   *     is null
   * @see java.util.TimeZone#getDisplayName(boolean, int, java.util.Locale)
   */

// NO WARRANTY!  This class is in the public domain.
/**
* Default base class for SAX2 event handlers.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class is available as a convenience base class for SAX2
* applications: it provides default implementations for all of the
* callbacks in the four core SAX2 handler classes:</p>
*
* <ul>
* <li>{@link org.xml.sax.EntityResolver EntityResolver}</li>
* <li>{@link org.xml.sax.DTDHandler DTDHandler}</li>
* <li>{@link org.xml.sax.ContentHandler
 ContentHandler}</li>
* <li>{@link org.xml.sax.ErrorHandler ErrorHandler}</li>
* </ul>
*
* <p>Application writers can extend this class when they need to
* implement only part of an interface; parser writers can
* instantiate this class to provide default handlers when the
```

```
* application has not supplied its own.</p>
*
* <p>This class replaces the deprecated SAX1
* {@link org.xml.sax.HandlerBase HandlerBase} class.</p>
*
* @since SAX 2.0
* @author David Megginson,
* @see org.xml.sax.EntityResolver
* @see org.xml.sax.DTDHandler
* @see org.xml.sax.ContentHandler
* @see org.xml.sax.ErrorHandler
*/

*/
/**
   * Creates a new JSRInliner. <i>Subclasses must not use this
   * constructor</i>. Instead, they must use the
   * {@link #JSRInlinerAdapter(int, MethodVisitor, int, String, String, String, String[])}
   * version.
   *
   * @param mv
   *          the <code>MethodVisitor</code> to send the resulting inlined
```

```
   *          method code to (use <code>null</code> for none).
   * @param access
   *          the method's access flags (see {@link Opcodes}). This
   *          parameter also indicates if the method is synthetic and/or
   *          deprecated.
   * @param name
   *          the method's name.
   * @param desc
   *          the method's descriptor (see {@link Type}).
   * @param signature
   *          the method's signature. May be <tt>null</tt>.
   * @param exceptions
   *          the internal names of the method's exception
 classes (see
   *          {@link Type#getInternalName() getInternalName}). May be
   *          <tt>null</tt>.
   * @throws IllegalStateException
   *           If a subclass calls this constructor.

*/
/**
    * Gets a specified property for an algorithm. The algorithm name
    * should be a standard name. See the <a href=
    * "{@docRoot}/../technotes/guides/security/StandardNames.html">
    * Java Cryptography Architecture Standard Algorithm Name Documentation</a>
    * for information about standard algorithm names.
    *
    * One possible use is by specialized algorithm parsers, which may map
    * classes to algorithms which they understand (much like Key parsers
    * do).
    *
```

```
   * @param algName the algorithm name.
   *
   * @param propName the name of the property to get.
   *
   * @return the value of the specified property.
   *
   * @deprecated This method used to return
 the value of a proprietary
   * property in the master file of the "SUN" Cryptographic Service
   * Provider in order to determine how to parse algorithm-specific
   * parameters. Use the new provider-based and algorithm-independent
   * {@code AlgorithmParameters} and {@code KeyFactory} engine
   * classes (introduced in the J2SE version 1.2 platform) instead.
   */

/**
* This exception is raised if an operation implementation
* throws a non-CORBA exception (such as an exception
* specific to the implementation's programming language),
* or if an operation raises a user exception that does not
* appear in the operation's raises expression. UNKNOWN is
* also raised if the server returns a system exception that
* is unknown to the client. (This can happen if the server
* uses a later version of CORBA than the client and new system
* exceptions have been added to the later version.)<P>
* It contains a minor code, which gives more detailed information about
* what caused the exception, and a completion status. It may also contain
* a string describing the exception.
 * <P>
* See the section <A href="../../../../technotes/guides/idl/jidlExceptions.html#minorcodemeanings">Minor

* Code Meanings</A> to see the minor codes for this exception.
*
* @see <A href="../../../../technotes/guides/idl/jidlExceptions.html">documentation on
* Java IDL exceptions</A>

/**
* A single input source for an XML entity.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p>This class allows a SAX application to encapsulate information
```

```
* about an input source in a single object, which may include
* a public identifier, a system identifier, a byte stream (possibly
* with a specified encoding), and/or a character stream.</p>
*
* <p>There are two places that the application can deliver an
* input source to the parser: as the argument to the Parser.parse
 * method, or as the return value of the EntityResolver.resolveEntity
* method.</p>
*
* <p>The SAX parser will use the InputSource object to determine how
* to read XML input.  If there is a character stream available, the
* parser will read that stream directly, disregarding any text
* encoding declaration found in that stream.
* If there is no character stream, but there is
* a byte stream, the parser will use that byte stream, using the
* encoding specified in the InputSource or else (if no encoding is
* specified) autodetecting the character encoding using an algorithm
* such as the one in the XML specification.  If neither a character
* stream nor a
* byte stream is available, the parser will attempt to open a URI
* connection to the resource identified by the system
* identifier.</p>
*
* <p>An InputSource object belongs to the application: the SAX parser
* shall never modify it in any way (it may modify a copy if
* necessary).  However, standard processing of
 both byte and
* character streams is to close them on as part of end-of-parse cleanup,
* so applications should not attempt to re-use such streams after they
* have been handed to a parser.  </p>
*
* @since SAX 1.0
* @author David Megginson
* @see org.xml.sax.XMLReader#parse(org.xml.sax.InputSource)
* @see org.xml.sax.EntityResolver#resolveEntity

// NO WARRANTY!  This class is in the Public Domain.
/**
* Interface for reading an XML document using callbacks.
*
* <blockquote>
* <em>This module, both source code and documentation, is in the
* Public Domain, and comes with <strong>NO WARRANTY</strong>.</em>
* See <a href='http://www.saxproject.org'>http://www.saxproject.org</a>
* for further information.
* </blockquote>
*
* <p><strong>Note:</strong> despite its name, this interface does
* <em>not</em> extend the standard Java {@link java.io.Reader Reader}
* interface, because reading XML is a fundamentally different activity
* than reading character data.</p>
*
* <p>XMLReader is the interface that an XML parser's SAX2 driver must
* implement.
  This interface allows an application to set and
* query features and properties in the parser, to register
* event handlers for document processing, and to initiate
* a document parse.</p>
*
* <p>All SAX interfaces are assumed to be synchronous: the
* {@link #parse parse} methods must not return until parsing
* is complete, and readers must wait for an event-handler callback
* to return before reporting the next event.</p>
*
* <p>This interface replaces the (now deprecated) SAX 1.0 {@link
* org.xml.sax.Parser Parser} interface.  The XMLReader interface
* contains two important enhancements over the old Parser
* interface (as well as some minor ones):</p>
```

```
*
* <ol>
* <li>it adds a standard way to query and set features and
*  properties; and</li>
* <li>it adds Namespace support, which is required for many
*  higher-level XML standards.</li>
* </ol>
*
* <p>There are adapters available to convert a SAX1 Parser to
* a SAX2 XMLReader and vice-versa.</p>
*
* @since
 SAX 2.0
* @author David Megginson
* @see org.xml.sax.XMLFilter
* @see org.xml.sax.helpers.ParserAdapter
* @see org.xml.sax.helpers.XMLReaderAdapter
*/

// NO WARRANTY! This class is in the public domain.
/**
* Default implementation of the Attributes interface.
*
* <blockquote>
* This module, both source code and documentation, is in the
* Public Domain, and comes with NO WARRANTY.
* See http://www.saxproject.org
* for further information.
* </blockquote>

```
*
* <p>This class provides a default implementation of the SAX2
* {@link org.xml.sax.Attributes Attributes} interface, with the
* addition of manipulators so that the list can be modified or
* reused.</p>
*
* <p>There are two typical uses of this class:</p>
*
* <ol>
* <li>to take a persistent snapshot of an Attributes object
 *  in a {@link org.xml.sax.ContentHandler#startElement startElement} event; or</li>
* <li>to construct or modify an Attributes object in a SAX2 driver or filter.</li>
* </ol>
*
* <p>This class replaces the now-deprecated SAX1 {@link
* org.xml.sax.helpers.AttributeListImpl AttributeListImpl}
* class; in addition to supporting the updated Attributes
* interface rather than the deprecated {@link org.xml.sax.AttributeList
* AttributeList} interface, it also includes a much more efficient
* implementation using a single array rather than a set of Vectors.</p>
*
* @since SAX 2.0
* @author David Megginson
*/

*/
/**
   * This method creates a new MBeanServer implementation object.
   * When creating a new MBeanServer the
   * {@link javax.management.MBeanServerFactory} first calls
   * <code>newMBeanServerDelegate()</code> in order to obtain a new
   * {@link javax.management.MBeanServerDelegate} for the new
   * MBeanServer. Then it calls
   * <code>newMBeanServer(defaultDomain,outer,delegate)</code>
   * passing the <var>delegate</var> that should be used by the
   * MBeanServer  implementation.
   * <p>Note that the passed <var>delegate</var> might not be directly the
   * MBeanServerDelegate that was returned by this implementation. It could
   * be, for instance, a new object wrapping the
 previously
   * returned delegate.
   * <p>The <var>outer</var> parameter is a pointer to the MBeanServer that
   * should be passed to the {@link javax.management.MBeanRegistration}
   * interface when registering MBeans inside the MBeanServer.
   * If <var>outer</var> is <code>null</code>, then the MBeanServer
   * implementation is free to use its own <code>this</code> pointer when
   * invoking the {@link javax.management.MBeanRegistration} interface.
   * <p>This makes it possible for a MBeanServer implementation to wrap
   * another MBeanServer implementation, in order to implement, e.g,
   * security checks, or to prevent access to the actual MBeanServer
   * implementation by returning a pointer to a wrapping object.
   * <p>
   * This MBeanServerBuilder makes it possible to create MBeanServer
   * which support {@link com.sun.jmx.interceptor.MBeanServerInterceptor}s.
   *
   * @param defaultDomain Default domain of the new MBeanServer.
   *
 @param outer A pointer to the MBeanServer object that must be
   *       passed to the MBeans when invoking their
   *       {@link javax.management.MBeanRegistration} interface.
   * @param delegate A pointer to the MBeanServerDelegate associated
```

```
   *       with the new MBeanServer. The new MBeanServer must register
   *       this MBean in its MBean repository.
   *
   * @return A new private implementation of an MBeanServer.
   **/
