Introduction

This document provides a sample configuration for ISDN backup, and provides basic troubleshooting information for this type of configuration.

For information on the most common implementations of ISDN backup, and comparisons between these, refer to the following document: [Evaluating Backup Interfaces, Floating Static Routes, and Dialer Watch for DDR Backup](#).

Prerequisites

Requirements

There are no specific prerequisites for this document.

Components Used

The information in this document is based on the software and hardware versions below.

- Two Cisco 2500 routers (Frame Relay data terminal equipment [DTEs]) running Cisco IOS® Software Releases 12.2(3) and 12.2(5).
- One Cisco 4500 router acting as a Frame Relay switch.

The information presented in this document was created from devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If you are working in a live network, ensure that you understand the potential impact of any command before using it.

Conventions

For more information on document conventions, see the [Cisco Technical Tips Conventions](#).

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only) .

Network Diagram

This document uses the network setup shown in the diagram below.

Configurations

This document uses the configurations shown below.

Verify

This section provides information you can use to confirm your configuration is working properly.

Use the following commands to verify your configuration:

Certain **show** commands are supported by the Output Interpreter tool, which allows you to view an analysis of **show** command output.

- **show interfaces serial**– Displays information about the multicast data-link connection identifier (DLCI), the DLCIs used on the interface, and the DLCI used for the Local Management Interface (LMI).
- **show interface dialer**– Displays information about the dialer interface.
- **show ip route**– Displays IP routing table entries.

```
krimson#show interface serial 1.1
```

```
! --- The initial state before the simulated Frame Relay network failure.
! --- The primary link is up and functional.
```

```
Serial1.1 is up, line protocol is up
Hardware is HD64570
Internet address is 10.5.5.2/24
Backup interface Dialer0, failure delay 0 sec,
secondary disable delay 0 sec

krimson#
```

Note: No specific configuration is needed on called side.

The same show output recorded during normal operation contains the following information:

```
kevin#show interface serial 0.1
Serial0.1 is up, line protocol is up

! --- The primary interface is up and running.

Hardware is HD64570
Internet address is 10.5.5.1/24
MTU 1500 bytes, BW 1544 Kbit, DLY 20000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation FRAME-RELAY

kevin#show interface dialer 0
Dialer0 is up (spoofing), line protocol is up (spoofing)

! --- Note: On the called side, the dialer interface is active
! --- and not in standby mode.

Hardware is Unknown
Internet address is 10.9.9.2/24
MTU 1500 bytes, BW 56 Kbit, DLY 20000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation PPP, loopback not set
DTR is pulsed for 1 seconds on reset
Last input lw6d, output never, output hang never
Last clearing of "show interface" counters 4w2d
Input queue: 0/75/0/0 (size/max/drops/flushes); Total output drops: 0
Queueing strategy: weighted fair
Output queue: 0/1000/64/0 (size/max total/threshold/drops)
Conversations 0/1/16 (active/max active/max total)
Reserved Conversations 0/0 (allocated/max allocated)
Available Bandwidth 42 kilobits/sec
5 minute input rate 0 bits/sec, 0 packets/sec
5 minute output rate 0 bits/sec, 0 packets/sec
598 packets input, 49252 bytes
596 packets output, 48924 bytes

Troubleshoot

This section provides information you can use to troubleshoot your configuration.

The Frame Relay configurations with point-to-point subinterfaces and Open Shortest Path First (OSPF) as a routing protocol used here are specific to this setup. However, the troubleshooting steps shown are more general and can be used with different configurations such as Frame Relay point-to-multipoint or a primary link with High-Level Data Link Control (HDLC) or Point to Point Protocol (PPP) encapsulation, regardless of the routing protocol used.

To verify the backup functionality, one of the interfaces on the Cisco 4500 router that is acting as a Frame Relay switch has been placed in shutdown state in order to simulate problem within the Frame Relay network. Consequently, this leads to the PVC inactive state being conducted to the DTE router via the Frame Relay network, and a Frame Relay subinterface down event. This activates the backup interface.

Troubleshooting Commands

Note: Before issuing **debug** commands, please see Important Information on Debug Commands.

- **debug isdn q931**
- **debug backup**– Debugs backup events.
- **debug dialer**– Displays debugging information about the packets or events on a dialer interface.
- **debug ppp negotiation** – Causes the **debug ppp** command to display PPP packets transmitted during PPP startup, where PPP options are negotiated.
- **debug ppp authentication** – Causes the **debug ppp** command to display authentication protocol messages, including Challenge Authentication Protocol (CHAP) packet exchanges and Password Authentication Protocol (PAP) exchanges.
- **debug ip ospf events** – Displays information on OSPF-related events, such as adjacencies, flooding information, designated router selection, and shortest path first (SPF) calculation
- **debug frame-relay events** – Displays debugging information about Frame Relay ARP replies on networks that support a multicast channel and use dynamic addressing.
