Introduction

Prerequisites

- Requirements
- Components Used

Problem

Solution

- Local Authorization Versus RADIUS Authorization
- Working Configuration
 - Router Configuration
 - RADIUS Server Configuration

Troubleshoot

- Internet Security Association and Key Management Protocol (ISAKMP) Debugs
- AAA debugs

Introduction

This document describes the behavior for Extended Authentication (XAUTH) for VPN users when both Authentication and Authorization are configured.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Authentication, Authorization, and Accounting (AAA)
- Remote Access VPN

Components Used

The information in this document is based on a Cisco Aggregation Services Router (ASR)1000 Series that runs Cisco IOS® XE software.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Problem

VPN users are configured in order to be authenticated and authorized by a RADIUS server. The configuration on the ASR is shown here:

```
aaa group server radius ACS-Rad
  server-private 10.88.171.27 key cisco123
  ip vrf forwarding Mgmt-intf
aaa group server tacacs+ ACS-Tac
  server-private 10.88.171.27 key cisco123
  ip vrf forwarding Mgmt-intf
aaa authentication login VPN_Client group ACS-Rad
aaa authentication login login_local local
aaa authorization network VPN_Client group ACS-Rad
aaa authorization network login_local local
aaa accounting network VPN_Client start-stop group ACS-Rad
aaa accounting network login_local start-stop group ACS-Rad
aaa session-id common
```

However, whenever you try to authenticate, you never get prompted for your credentials. On the client, this error message is seen in the log messages:

```
Unable to establish Phase 1 SA with server "X.X.X.X" because of
"DEL_REASON_PEER_NOT_RESPONDING"
```

The debugs on the ASR indicate that the VPN group name is used as the **User-Name** for the authorization attempt.

```
Sep 26 20:01:49.298: RADIUS(000025EA): Sending a IPv4 Radius Packet

Sep 26 20:01:49.326: ISAKMP/tunnel: received tunnel atts
Sep 26 20:01:49.326: ISAKMP:Error - skey id.
```

Note: However, everything works fine when local authorization is configured.

Solution

The reported behavior is expected and not a bug. Remote Access VPN has two separate authentication processes:

1. Preshared key authentication for the tunnel to which the user connects.
2. XAUTH which authenticates the individual user.

XAUTH is Phase 1.5 and occurs only after the preshared key authentication succeeds in Phase 1. The reason you are not able to see a user prompt for a password is because Phase 1 has not yet completed. The username that is sent in the debugs is actually for the Phase 1 preshared key authentication.

Local Authorization Versus RADIUS Authorization

When local authorization is configured, the VPN headend picks up the key value configured under the group configuration in order to complete Phase 1. This allows phase 1 to complete, so the router can proceed to XAUTH:

When the router is configured to authorize against the RADIUS server, it does not work because in order to get the **key** (for preshared authentication), it must do a access-request query to the RADIUS server. However, the access-request query requires a **username** to be sent to RADIUSA and since XAUTH is not done yet, it cannot use the client **user name**. In this situation, it uses the **group name** as the **user name** instead. However, since the RADIUS server has not been set up to verify any user by that ID, it rejects the request. Because of this, Phase 1 never completes, and the user is never prompted for credentials.

Working Configuration

Router Configuration

Here is the configuration for the router.

```
aaa group server radius Radius-Server
  server-private X.X.X.X auth-port 1812 acct-port 1813 key 7 <removed>

aaa authentication login VPN_Client group Radius-Server
aaa authorization network VPN_Client Radius-Server
aaa accounting network VPN_Client start-stop group Radius-Server

crypto isakmp policy 10
  encr 3des
  authentication pre-share
  group 2

crypto isakmp client configuration group vpnclient
  key <removed>
  dns x.x.x.x
  wins x.x.x.x
  domain cisco.com
  pool VPN_Pool
  acl 101
  group-lock

crypto isakmp profile vpnclient.cisco.com
  match identity group vpnclinet
  client authentication list VPN_Client
  isakmp authorization list VPN_Client
  client configuration address respond
  accounting VPN_Client

crypto ipsec transform-set TRANS-DES esp-des esp-md5-hmac
  mode tunnel

crypto dynamic-map DYN-MAP 10
  set transform-set TRANS-DES
  set isakmp-profile vpnclient.cisco.com
  reverse-route
```

```
crypto map VPN local-address TenGigabitEthernet 0/0/0
crypto map VPN 10 ipsec-isakmp dynamic DYN-MAP
```

```
interface TenGigabitEthernet0/0/0
ip address X.X.X.X 255.255.255.0
crypto map VPN
```

RADIUS Server Configuration

Complete these steps in order to configure the RADIUS server.

1. Configure the *Groupname* user:

The screenshot shows a configuration page for a RADIUS user profile. The 'General' tab is selected. The 'Name' field is set to 'vpncclient.cisco.com' and the 'Status' is 'Enabled'. The 'Description' is 'Profile for VPN Clients'. The 'Identity Group' is set to 'All Groups'. Under 'Password Information', the password must contain 4-32 characters. There are fields for 'Password' and 'Confirm Password', both containing '****'. A checkbox for 'Change password on next login' is unchecked. Under 'User Information', the ACS-RESERVED-Never-Expired setting is checked. A note at the bottom indicates that orange circles = Required fields.

2. Configure an Authorization profile in order to give all Attribute Value (AV) Pairs:

The screenshot shows a configuration page for an Authorization profile. The 'General' tab is selected. The 'Name' field is set to 'vpncclient.cisco.com'. The 'Description' is 'Profile for VPN Clients'. A note at the bottom indicates that orange circles = Required fields.

*General Common Tasks RADIUS Attributes

Common Tasks Attributes

Attribute	Type	Value

Manually Entered

Attribute	Type	Value
CVPN3000/ASA/PIX7.x-IPSec-Authentication	Enumeration	Internal
CVPN3000/ASA/PIX7.x-Group-Based-Address	String	VPN_Pool
CVPN3000/ASA/PIX7.x-Access-List-Inbound	String	101
CVPN3000/ASA/PIX7.x-IPSec-Group-Name	String	vpnclient.cisco.com
CVPN3000/ASA/PIX7.x-IPSec-Split-DNS-Nan	String	X.X.X

Add A Edit V Replace A Delete

Dictionary Type: RADIUS-Cisco VPN 3000/ASA/PIX 7.x

RADIUS Attribute: Select

Attribute Type:

Attribute Value: Static

¤ = Required fields

3. Configure an Access policy in order to permit the connection and use that profile:

The screenshot shows the 'General' tab of a policy rule configuration. The rule is named 'Rule-1' and is set to 'Enabled'. A blue information icon with a white 'i' is present. Below it, a note states: 'The Customize button in the lower right area of the policy rules screen controls which policy conditions and results are available here for use in policy rules.' The 'Conditions' section contains three fields: 'NDG:Location' (set to '-ANY-'), 'Time And Date' (set to '-ANY-'), and 'Device IP Address' (set to '!= a.a.a.a'). The 'Results' section includes an 'Authorization Profiles' list containing 'vpnclient.cisco.com'. A note next to the list says: 'You may select multiple authorization profiles. Attributes defined in multiple profiles will use the value from the first profile defined.' At the bottom are 'Select' and 'Deselect' buttons.

Troubleshoot

The Output Interpreter Tool (registered customers only) supports certain ***show*** commands. Use the Output Interpreter Tool in order to view an analysis of ***show*** command output.

Note: Refer to Important Information on Debug Commands before you use ***debug*** commands.

These debugs are enabled on the VPN headend:

Internet Security Association and Key Management Protocol (ISAKMP) Debugs

```
debug crypto isakmp
```

AAA debugs

```
debug aaa authentication  
debug aaa authorization  
debug aaa accounting  
debug radius authentication
```
