Introduction

This document describes the behavior of IP device tracking after MAB config and possible solutions for communication issue after MAB authentication.

Prerequisites

Requirements

Cisco recommends that you have knowledge of these topics:

- Configuration of Cisco Identity Services Engine
- Configuration of Cisco Catalyst

Components Used

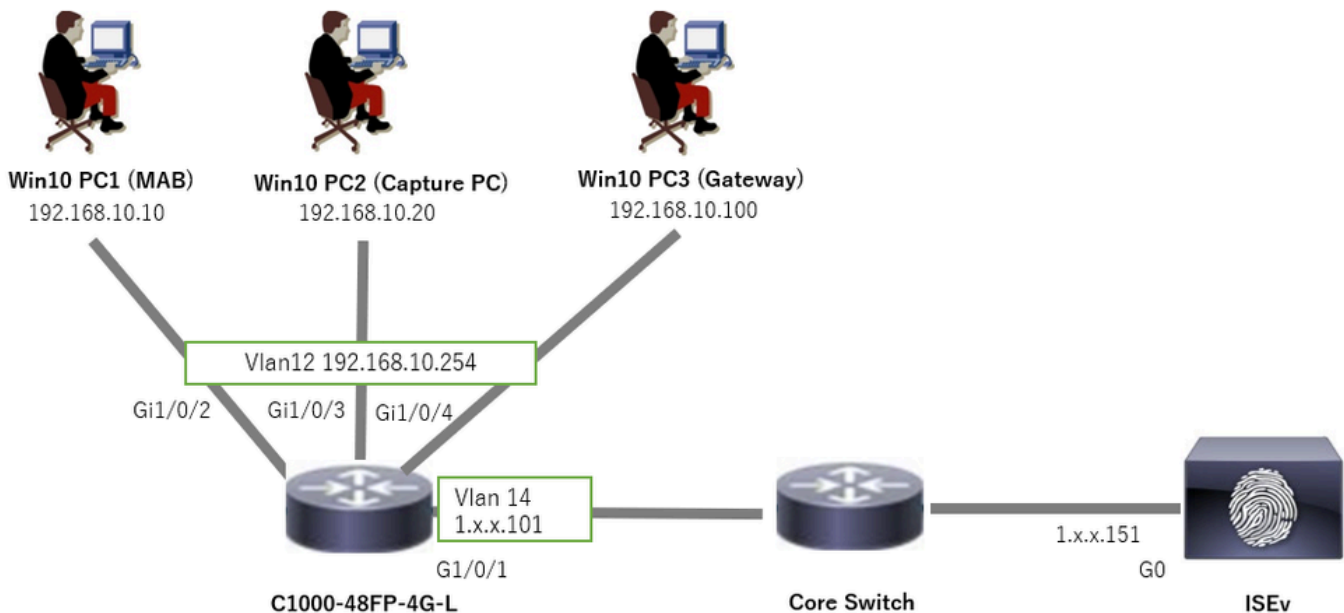

The information in this document is based on these software and hardware versions:

- Identity Services Engine Virtual 3.3 Patch 1
- C1000-48FP-4G-L 15.2(7)E9

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, ensure that you understand the potential impact of any command.

Diagram

This document introduces the configuration and verification for MAB authentication on this diagram.

Network Diagram

Background Information

Even though MAB authentication succeeds, after rebooting (or unplugging and replugging the cable) Win10 PC1, it cannot ping the gateway (Win10 PC3) successfully. This unexpected behavior is due to an IP address conflict on Win10 PC1.

IP device tracking and its ARP probes is enabled by default on the interface which is configured MAB. When Windows PC are connected to a Catalyst Switch with IP device tracking enabled, there is a possibility that the Windows side detects an IP address conflict. This occurs because an ARP Probe (with a sender IP address of 0.0.0.0) is received during the detection window of this mechanism, it is treated as an IP address conflict.

Configuration

This configuration example demonstrates the behavior of IP device tracking after MAB configuration.

Configuration in C1000

This is the minimal configuration in C1000 CLI.

```
aaa new-model

radius server ISE33
address ipv4 1.x.x.191
key cisco123

aaa group server radius AAASERVER
server name ISE33

```

Configuration in ISE

Step 1. Add Device

Navigate to **Administration > Network Devices**, click **Add** button to add C1000 device.

- **Name** : C1000
- **IP Address** : 1.x.x.101

The screenshot shows the 'New Network Device' configuration page in the Cisco Identity Services Engine. The form is titled 'Network Devices' and includes the following fields and settings:

- Name:** C1000
- IP Address:** 1.1.1.101 / 32
- Device Profile:** Cisco
- Model Name:** (empty)
- Software Version:** (empty)
- Network Device Group:** (empty)
- Location:** All Locations (Set To Default)
- IPSEC:** Is IPSEC Device (Set To Default)
- Device Type:** All Device Types (Set To Default)
- RADIUS Authentication Settings:** (checked)
 - RADIUS UDP Settings:**
 - Protocol:** RADIUS
 - Shared Secret:** cisco123

Add Device

Step 2. Add Endpoint

Navigate to **Context Visibility > Endpoints**, click **Add** button to add MAC of Endpoint.

The screenshot shows the 'Add Endpoint' dialog box in the Cisco Identity Services Engine. The dialog box is titled 'Add Endpoint' and includes the following fields and settings:

- Mac Address*:** B4-9E-9117-1C-1A-1A
- Description:** (empty)
- Static Assignment:** (unchecked)
- Static Group Assignment:** (unchecked)
- Policy Assignment:** Unknown
- Identity Group Assignment:** Unknown

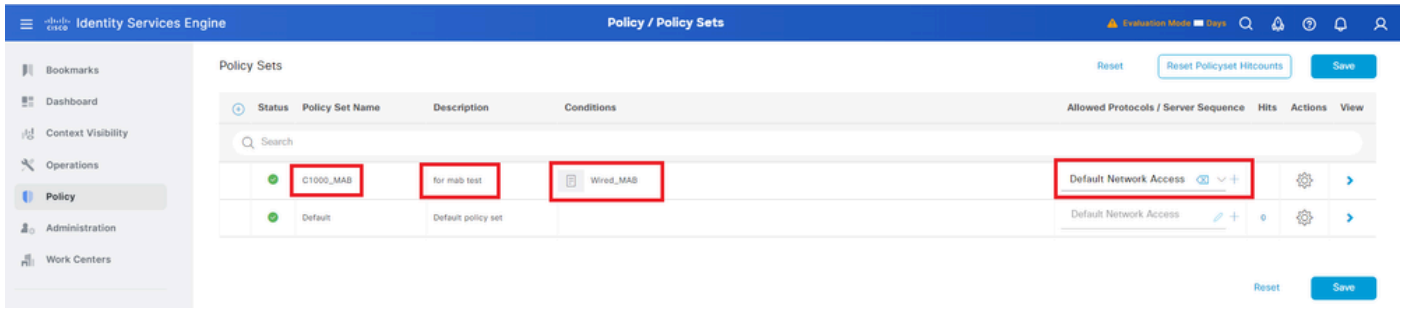

Add Endpoint

Step 3. Add Policy Set

Navigate to **Policy > Policy Sets**, click + to add a policy set.

- **Policy Set Name** : C1000_MAB
- **Description** : for mab test
- **Conditions** : Wired_MAB

- **Allowed Protocols / Server Sequence** : Default Network Access

Add Policy Set

Step 4. Add Authentication Policy

Navigate to **Policy Sets**, click **C1000_MAB** to add an authentication policy.

- **Rule Name** : MAB_authentication
- **Conditions** : Wired_MAB
- **Use** : Internal Endpoints

Add Authentication Policy

Step 5. Add Authorization Policy

Navigate to **Policy Sets**, click **C1000_MAB** to add an authorization policy.

- **Rule Name** : MAB_authorization
- **Conditions** : Network_Access_Authentication_Passed
- **Results** : PermitAccess

Add Authorization Policy

Verify

Before Configuration of MAB

Run `show ip device tracking all` command to confirm that IP device tracking feature is disabled.

```
<#root>
```

```
Switch #
```

```
show ip device tracking all
```

```
Global IP Device Tracking for clients =
```

```
Disabled
```

```
-----  
IP Address MAC Address Vlan Interface Probe-Timeout State Source  
-----
```

After Configuration of MAB

Step 1. Before MAB Authentication

Run `show ip device tracking all` command to confirm that IP device tracking feature is enabled.

```
<#root>
```

```
Switch #
```

```
show ip device tracking all
```

```
Global IP Device Tracking for clients =
```

```
Enabled
```

```
Global IP Device Tracking Probe Count = 3
```

```
Global IP Device Tracking Probe Interval = 30
```

```
Global IP Device Tracking Probe Delay Interval = 0
```

```
-----  
IP Address MAC Address Vlan Interface Probe-Timeout State Source  
-----
```

```
Total number interfaces enabled: 1
```

```
Enabled interfaces:
```

```
Gi1/0/2
```

Step 2. After MAB Authentication

Initialize MAB authentication from Win10 PC1 and run `show ip device tracking all` command to confirm the status of IP device tracking on GigabitEthernet1/0/2.

<#root>

Switch #

```
show ip device tracking all
```

Global IP Device Tracking for clients =

Enabled

Global IP Device Tracking Probe Count = 3

Global IP Device Tracking Probe Interval = 30

Global IP Device Tracking Probe Delay Interval = 0

IP Address MAC Address Vlan Interface Probe-Timeout State Source

192.168.10.10

b496.9115.84cb 12 GigabitEthernet1/0/2 30

ACTIVE

ARP

Total number interfaces enabled: 1

Enabled interfaces:

Gi1/0/2

Step 3. Confirm Authentication Session

Run `show authentication sessions interface GigabitEthernet1/0/2 details` command to confirm the MAB authentication session.

<#root>

Switch #

```
show authentication sessions interface GigabitEthernet1/0/2 details
```

Interface: GigabitEthernet1/0/2

MAC Address: b496.9115.84cb

IPv6 Address: Unknown

IPv4 Address: 192.168.10.10

User-Name: B4-96-91-15-84-CB

Status: Authorized

Domain: DATA

Oper host mode: multi-auth

Oper control dir: both

Session timeout: N/A

Restart timeout: N/A

Periodic Acct timeout: N/A

Session Uptime: 114s

Common Session ID: 01C200650000001D62945338

Acct Session ID: 0x0000000F

Handle: 0xBE000007

Current Policy: POLICY_Gi1/0/2

Local Policies:

Service Template: DEFAULT_LINKSEC_POLICY_SHOULD_SECURE (priority 150)

Server Policies:

Method status list:

Method State

mab Authc Success

Step 4. Confirm Radius Live Log

Navigate to **Operations > RADIUS > Live Logs** in ISE GUI, confirm the live log for MAB authentication.

Time	Status	Details	Repea...	Identity	Endpoint ID	Endpoint Profile	Authentication Policy	Authorization Policy	Authorization Profiles	IP Address	Network De...
Feb 25, 2024 04:32:06.437 PM	Success		0	84:96:91:15:84:CB	84:96:91:15:84:CB	Intel-Device	C1000_MAB >> MAB_authentication	C1000_MAB >> MAB_authorizati...	PermitAccess	192.168.10.10	
Feb 25, 2024 04:32:05.396 PM	Success			84:96:91:15:84:CB	84:96:91:15:84:CB	Intel-Device	C1000_MAB >> MAB_authentication	C1000_MAB >> MAB_authorizati...	PermitAccess	192.168.10.10	C1000

Step 5. Confirm Packet Detail of IP Device Tracking

Run `show interfaces GigabitEthernet1/0/2` command to confirm the MAC address of GigabitEthernet1/0/2.

```
<#root>
```

```
Switch #
```

```
show interfaces GigabitEthernet1/0/2
```

```
GigabitEthernet1/0/2 is up, line protocol is up (connected)
Hardware is Gigabit Ethernet, address is 3c41.0e4f.1782 (bia 3c41.0e4f.1782)
```

In the packet capture, confirm that ARP probes are sent by GigabitEthernet1/0/2 every 30s.

ARP Probes

In the packet capture, confirm that the sender IP address of ARP Probes are 0.0.0.0.

```

> Frame 74: 60 bytes on wire (480 bits), 60 bytes captured (480 bits) on interface 0
> Ethernet II, Src: 3c:41:0e:4f:17:82 (3c:41:0e:4f:17:82), Dst: IntelCor_15:84:cb (b4:96:91:15:84:cb)
  Address Resolution Protocol (request)
    Hardware type: Ethernet (1)
    Protocol type: IPv4 (0x0800)
    Hardware size: 6
    Protocol size: 4
    Opcode: request (1)
    Sender MAC address: 3c:41:0e:4f:17:82 (3c:41:0e:4f:17:82)
    Sender IP address: 0.0.0.0
    Target MAC address: IntelCor_15:84:cb (b4:96:91:15:84:cb)
    Target IP address: 192.168.10.10

```

Detail of ARP Probes

Problem

There is a possibility that the IP device tracking feature of the Catalyst Switch could cause an IP address conflict on a Windows PC when it sends an ARP Probe with a sender IP address of 0.0.0.0.

Possible Solutions

Please refer to [Troubleshoot Duplicate IP Address 0.0.0.0 Error Messages](#) for possible solutions. Here are examples of each solution tested in a Cisco lab for further details.

1. Delay the Sending of ARP Probes

Run `ip device tracking probe delay <1-120>` command to delay the sending of ARP probes from Switch. This command does not allow a Switch to send a probe for <1-120> seconds when it detects a link UP/flap, which minimizes the possibility to have the probe sent while the host on the other side of the link checks for duplicate IP addresses.

This is an example to config the delay of ARP probe for 10s.

```
Switch (config)#ip device tracking probe delay 10
```

Run `show ip device tracking all` command to confirm the setting of delay.

```
<#root>
```

```
Switch #show ip device tracking all
Global IP Device Tracking for clients = Enabled
Global IP Device Tracking Probe Count = 3
Global IP Device Tracking Probe Interval = 30

Global IP Device Tracking Probe Delay Interval = 10
```

```
-----
IP Address MAC Address Vlan Interface Probe-Timeout State Source
```

```
-----  
192.168.10.10 b496.9115.84cb 12 GigabitEthernet1/0/2 30 ACTIVE ARP
```

```
Total number interfaces enabled: 1  
Enabled interfaces:  
Gi1/0/2
```

2. Config Auto-Source for ARP Probes

Run `ip device tracking probe auto-source fallback <host-ip> <mask> [override]` command to change the source IP address for ARP Probes. With this command, the IP source of ARP Probes is not be 0.0.0.0, but it is the IP address of Switch Virtual Interface (SVI) in the VLAN where the host resides, or it is automatically calculated if the SVI does not have an IP address set.

This is an example to config the <host-ip> to 0.0.0.200.

```
Switch (config)#ip device tracking probe auto-source fallback 0.0.0.200 255.255.255.0 override
```

Pattern 1. IP of SVI is Configured

In this document, since the SVI IP address (the IP address of vlan12) is set for the interface (GigabitEthernet1/0/2) performing MAB authentication, the source IP address for the ARP probe is changed to 192.168.10.254.

Run `show ip device tracking all` command to confirm the setting of auto source.

```
<#root>
```

```
Switch #show ip device tracking all  
Global IP Device Tracking for clients = Enabled  
Global IP Device Tracking Probe Count = 3  
Global IP Device Tracking Probe Interval = 30  
Global IP Device Tracking Probe Delay Interval = 0  
IP Device Tracking Probe Auto Source = Enabled  
  
Probe source IP selection order: SVI,Fallback 0.0.0.200 255.255.255.0
```

```
-----  
IP Address MAC Address Vlan Interface Probe-Timeout State Source  
-----
```

```
192.168.10.10 b496.9115.84cb 12 GigabitEthernet1/0/2 30 ACTIVE ARP
```

```
Total number interfaces enabled: 1  
Enabled interfaces:  
Gi1/0/2
```

In the packet capture, confirm that ARP probes are sent by GigabitEthernet1/0/2 every 30s.

    Sender IP address: 192.168.10.254
    Target MAC address: IntelCor_15:84:cb (b4:96:91:15:84:cb)
    Target IP address: 192.168.10.10

```

Detail of ARP Probes

Pattern 2. IP of SVI is Not Configured

In this document, as the destination for the ARP probe is 192.168.10.10/24, if the SVI IP address is not configured, the source IP address is 192.168.10.200.

Delete the IP address of SVI.

```
Switch (config)#int vlan 12
Switch (config-if)#no ip address
```

Run `show ip device tracking all` command to confirm the setting of auto source.

```
<#root>
```

```
Switch #show ip device tracking all
Global IP Device Tracking for clients = Enabled
Global IP Device Tracking Probe Count = 3
Global IP Device Tracking Probe Interval = 30
Global IP Device Tracking Probe Delay Interval = 0
IP Device Tracking Probe Auto Source = Enabled

Probe source IP selection order: SVI,Fallback 0.0.0.200 255.255.255.0
```

IP Address MAC Address Vlan Interface Probe-Timeout State Source

192.168.10.10 b496.9115.84cb 12 GigabitEthernet1/0/2 30 ACTIVE ARP

Detail of ARP Probes

3. Forcibly Disable IP Device Tracking

Run `ip device tracking maximum 0` command to disable IP device tracking.

Note: This command does not truly disable IP device tracking, but it does limit the number of tracked hosts to zero.

```
Switch (config)#int g1/0/2
Switch (config-if)#ip device tracking maximum 0
```

Run `show ip device tracking all` command to confirm the status of IP device tracking on GigabitEthernet1/0/2.

```
Switch #show ip device tracking all
Global IP Device Tracking for clients = Enabled
Global IP Device Tracking Probe Count = 3
Global IP Device Tracking Probe Interval = 30
Global IP Device Tracking Probe Delay Interval = 0
```
