Configuración de servicios de conmutación SNA en DLSw

Contenido

Introducción Prerequisites Requirements Componentes Utilizados Convenciones Configurar Diagrama de la red Configuraciones Verificación Troubleshoot Información Relacionada

Introducción

Este documento describe cómo configurar un router y un ordenador central para utilizar Systems Network Architecture Switching Services (SNASw) sobre Data-Link Switching (DLSw), para conectar el flujo ascendente al mainframe y el descendente a un nodo de Unidad física (PU) 2.0 heredado. En este documento, por ejemplo, la conexión ascendente al sistema central se realiza a través de un Procesador de interfaz de canal (CIP), y el nodo PU 2.0 se conecta al sistema central a través del conducto del solicitante de unidad lógica dependiente (DLUR) establecido por SNASw.

Prerequisites

Requirements

No hay requisitos específicos para este documento.

Componentes Utilizados

La información que contiene este documento se basa en las siguientes versiones de software y hardware.

- ¿SNASw 4700 con Cisco IOS? Versión de software 12.1(7)
- CIP 7507 con Cisco IOS Software Release 12.1(7)
- Unidad física descendente (DSPU) 4700 con la versión 12.0(10) del software del IOS de Cisco

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Convenciones

Para obtener más información sobre las convenciones del documento, consulte <u>Convenciones de</u> <u>Consejos Técnicos de Cisco</u>.

Configurar

En esta sección encontrará la información para configurar las funciones descritas en este documento.

Nota: Para encontrar información adicional sobre los comandos usados en este documento, utilice la <u>Command Lookup Tool</u> (sólo clientes registrados).

Diagrama de la red

En este documento, se utiliza esta configuración de red:

La DSPU sólo se utiliza para activar una PU en el Token Ring. Tenga en cuenta que el MAC remoto (rmac) al que se conecta es la dirección MAC especificada en el puerto Virtual Data-Link Control (VDLC) que se define como SNASw en Brachio.

Configuraciones

En este documento, se utilizan estas configuraciones:

- Brachio
- <u>FEP</u>
- Párr
- Sistema central

Se requiere una instrucción de link solamente para la conexión ascendente, y solamente se necesita una definición de puerto VDLC tanto para las conexiones ascendente como para las descendentes.

Verificación

Esta sección proporciona información que puede utilizar para confirmar que su configuración funciona correctamente.

La herramienta <u>Output Interpreter</u> (sólo para clientes registrados) permite utilizar algunos comandos "show" y ver un análisis del resultado de estos comandos.

Estos ejemplos de **salida del comando show** muestran información de estado para los routers en la configuración de ejemplo:

para# show dspu

dspu host DPU4 Vdlc PU STATUS Active FRAMES RECEIVED 7 FRAMES SENT 7 LUS USED BY DSPU 0 LUS ACTIVE 0 LUS USED BY API 0 LUS ACTIVE 0 LUS ACTIVATED BY HOST BUT NOT USED 6

brachio# show snasw link
