Introduction

Ce document décrit comment Firepower Threat Defense (FTD) transfère les paquets et met en oeuvre divers concepts de routage.

Conditions préalables

Exigences

- Connaissances de base du routage

Composants utilisés

Les informations contenues dans ce document sont basées sur les versions de matériel et de

logiciel suivantes :

- Cisco Firepower 41xx Threat Defense Version 7.1.x
- Firepower Management Center (FMC) version 7.1.x

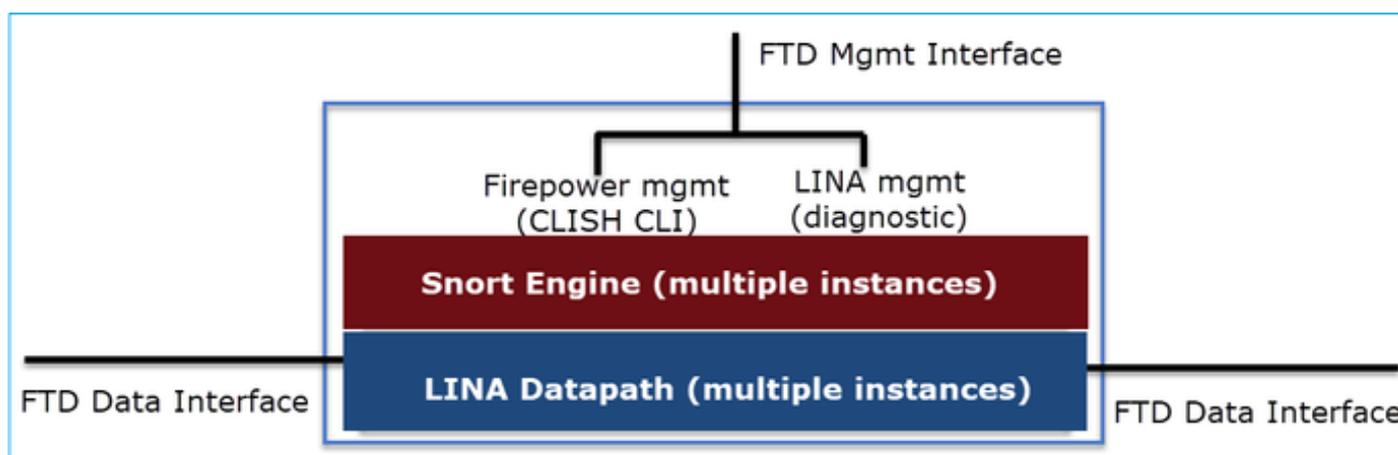

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Si votre réseau est en ligne, assurez-vous de bien comprendre l'incidence possible des commandes.

Informations générales

Mécanismes de transfert de paquets FTD

Cisco Firepower Threat Defense (FTD) est une image logicielle unifiée qui comprend deux moteurs principaux :

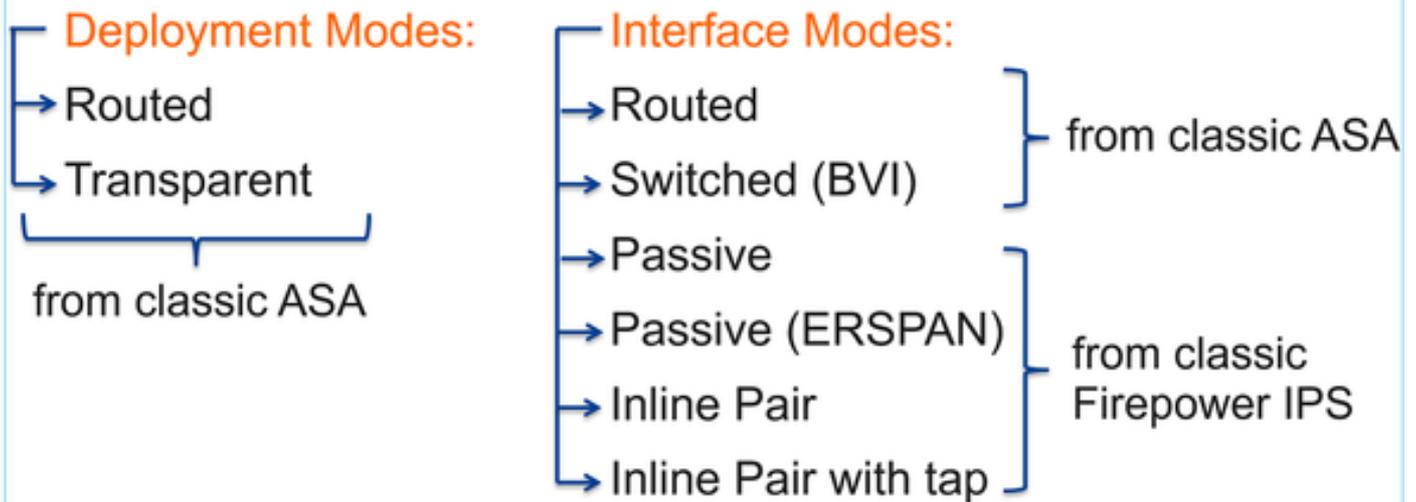

- Moteur de chemin de données (LINA)
- Moteur du renifleur

Le chemin de données et le moteur Snort sont les principales parties du plan de données du FTD.

Le mécanisme de transfert du plan de données FTD dépend du mode d'interface. L'image suivante résume les différents modes d'interface ainsi que les modes de déploiement FTD :

FTD Deployment and Interface Modes

Le tableau résume la façon dont le FTD transmet les paquets dans le plan de données en fonction du mode d'interface. Les mécanismes de transfert sont répertoriés par ordre de préférence :

FTD Deployment mode	FTD Interface mode	Forwarding Mechanism
Routed	Routed	Packet forwarding based on the following order: 1. Connection lookup 2. Nat lookup (xlate) 3. Policy Based Routing (PBR) 4. Global routing table lookup
Routed or Transparent	Switched (BVI)	1. NAT lookup 2. Destination MAC Address L2 Lookup*
Routed or Transparent	Inline Pair	The packet will be forwarded based on the pair configuration.
Routed or Transparent	Inline Pair with Tap	The original packet will be forwarded based on the pair configuration. The copy of the packet will be dropped internally
Routed or Transparent	Passive	The packet is dropped internally
Routed	Passive (ERSPAN)	The packet is dropped internally

* Un FTD en mode transparent effectue une recherche de route dans certaines situations :

MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the Firepower Threat Defense device—Add a default/static route on the Firepower Threat Defense device for traffic destined for a remote network where a syslog server, for example, is located.
- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the Firepower Threat Defense device for traffic destined for the remote endpoint so that secondary connections are successful. The Firepower Threat Defense device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the Firepower Threat Defense device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

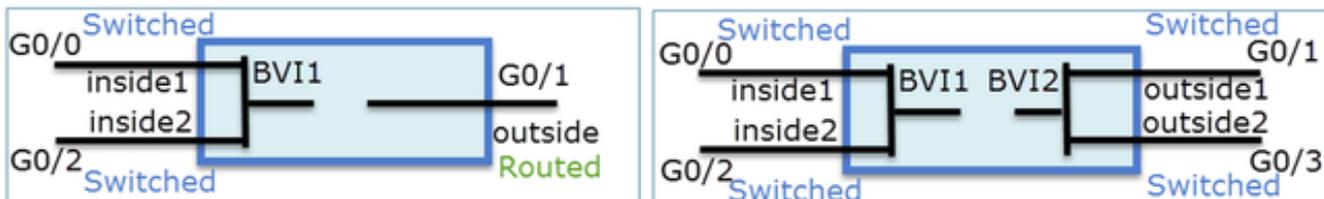

- H.323
 - RTSP
 - SIP
 - Skinny (SCCP)
 - SQL*Net
 - SunRPC
 - TFTP
- Traffic at least one hop away for which the Firepower Threat Defense device performs NAT—Configure a static route on the Firepower Threat Defense device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the Firepower Threat Defense device.

Consultez le [guide FMC](#) pour plus de détails.

À partir de la version 6.2.x, le FTD prend en charge le routage et le pontage intégrés (IRB) :

FTD Integrated Routing and Bridging (IRB)

- Available as from 6.2.x
- Allows an FTD in **Routed mode** to have multiple interfaces (up to 64) to be part of the **same VLAN** and perform L2 switching between them
- BVI-to-Routed or BVI-to-BVI Routing is allowed

Commandes de vérification BVI :

Verification commands

```
firepower# show bridge-group
```

```
firepower# show ip
Interface          Name                IP address    Subnet mask    Method
GigabitEthernet0/0  VLAN1576_G0-0      203.0.113.1  255.255.255.0  manual
GigabitEthernet0/1  VLAN1577_G0-1      192.168.1.15 255.255.255.0  manual
GigabitEthernet0/2  VLAN1576_G0-2      203.0.113.1  255.255.255.0  manual
GigabitEthernet0/4.100 SUB1                203.0.113.1  255.255.255.0  manual
BVI1                LAN                 203.0.113.1  255.255.255.0  manual
BVI2                LAN2                192.168.1.15 255.255.255.0  manual
```

- BVI nameif is used in L3 Routing configuration

```
firepower# show run route
route LAN 1.1.1.0 255.255.255.0 203.0.113.5 1
```

- BVI member nameif is used in policies like NAT configuration

```
firepower# show run nat
nat (VLAN1576_G0-0,VLAN1577_G0-1) source dynamic any interface
nat (VLAN1576_G0-2,VLAN1577_G0-1) source dynamic any interface
```

Point clé

Pour les interfaces routées ou les interfaces BVI (IRB), le transfert de paquets est basé sur cet ordre :

- Recherche de connexion
- Recherche NAT (destination NAT, également appelée UN-NAT)
- Routage basé sur des politiques (PBR)
- Recherche de table de routage globale

Et la NAT source ?

La NAT source est vérifiée après la recherche de routage globale.

Le reste de ce document se concentre sur le mode d'interface Routed.

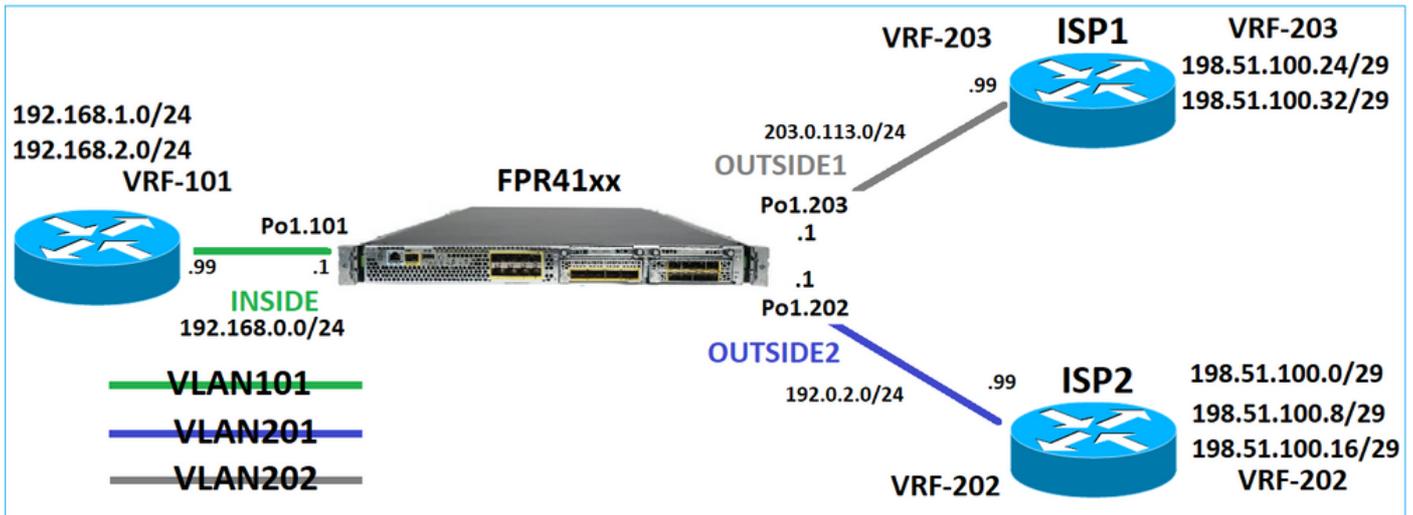

Comportement de routage du plan de données (LINA)

En mode d'interface routée, FTD LINA transfère les paquets en 2 phases :

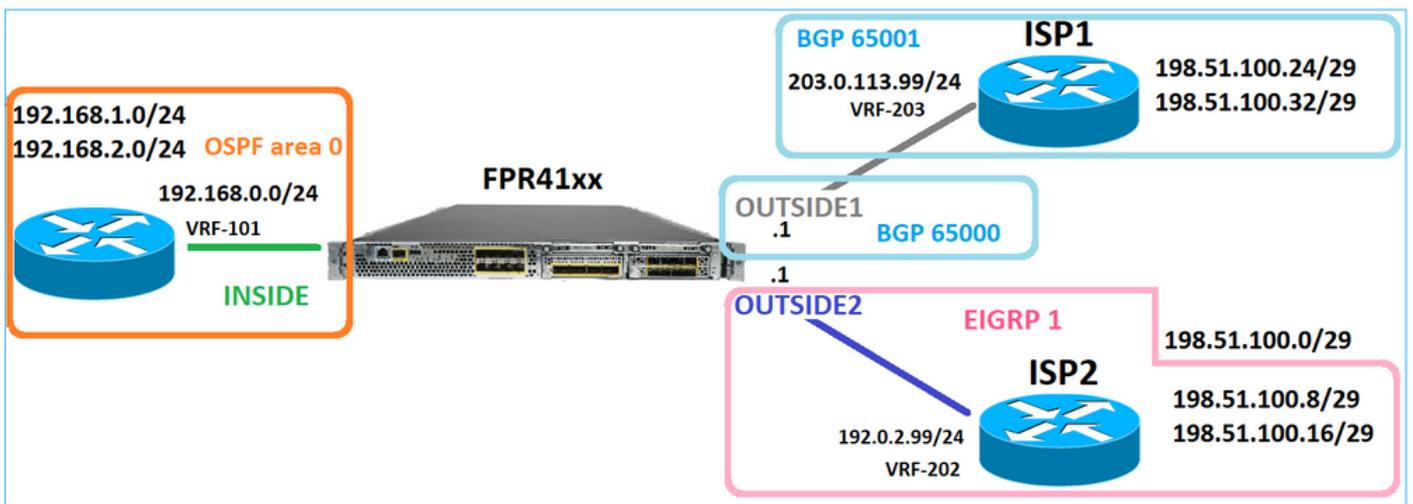

Phase 1 - Détermination de l'interface de sortie

Phase 2 - Sélection du tronçon suivant

Considérez cette topologie :

Et cette conception de routage :

La configuration de routage FTD :

```
firepower# show run router
router ospf 1

Points clés

Le FTD (d'une manière similaire à un dispositif de sécurité adaptatif - ASA), détermine d'abord l'interface de sortie (de sortie) d'un paquet (pour cela, il examine les entrées « in » de la table de routage ASP). Ensuite, pour l'interface déterminée, il essaie de trouver le tronçon suivant (pour cela, il regarde les entrées 'out' de la table de routage ASP). Exemple :

```

firepower# show asp table routing | include in.*198.51.100.0
in 198.51.100.0 255.255.255.248 via 192.0.2.99, OUTSIDE2
firepower#
firepower# show asp table routing | include out.*OUTSIDE2
out 255.255.255.255 255.255.255.255 OUTSIDE2
out 192.0.2.1 255.255.255.255 OUTSIDE2
out 198.51.100.0 255.255.255.248 via 192.0.2.99, OUTSIDE2
out 198.51.100.8 255.255.255.248 via 192.0.2.99, OUTSIDE2
out 198.51.100.16 255.255.255.248 via 192.0.2.99, OUTSIDE2
out 192.0.2.0 255.255.255.0 OUTSIDE2
out 224.0.0.0 240.0.0.0 OUTSIDE2

```

Enfin, pour le saut suivant résolu, le protocole LINA recherche une contiguïté valide dans le cache ARP.

L'outil FTD packet-tracer confirme ce processus :

```
firepower# packet-tracer input INSIDE icmp 192.168.1.1 8 0 198.51.100.1
```

```

OUTSIDE2 192.0.2.99 4c4e.35fc.fcd8 1

```

La table FTD ARP telle qu'elle apparaît dans le plan de données :

```

firepower# show asp table arp

Context: single_vf, Interface: OUTSIDE1
203.0.113.99 Active 4c4e.35fc.fcd8 hits 2 reference 1

Context: single_vf, Interface: OUTSIDE2
192.0.2.99 Active 4c4e.35fc.fcd8 hits 5 reference 0

Context: single_vf, Interface: INSIDE
192.168.0.99 Active 4c4e.35fc.fcd8 hits 5 reference 0

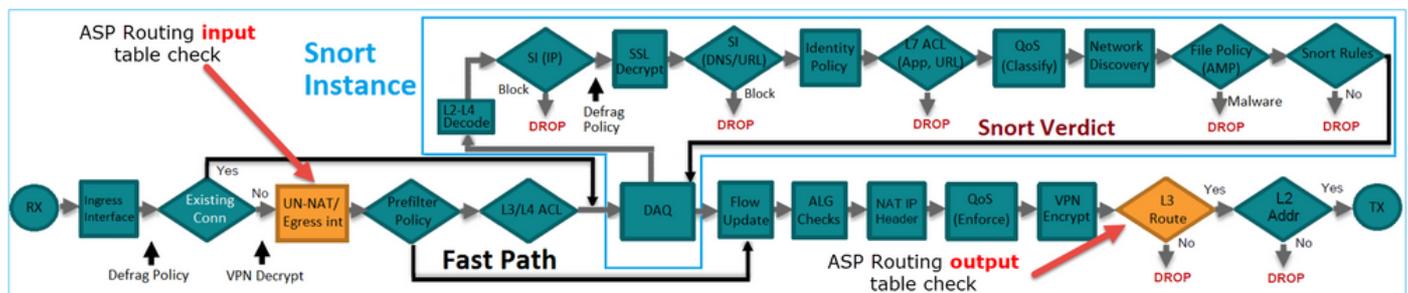

Context: single_vf, Interface: identity
:: Active 0000.0000.0000 hits 0 reference 0
0.0.0.0 Active 0000.0000.0000 hits 848 reference 0

Last clearing of hits counters: Never

```

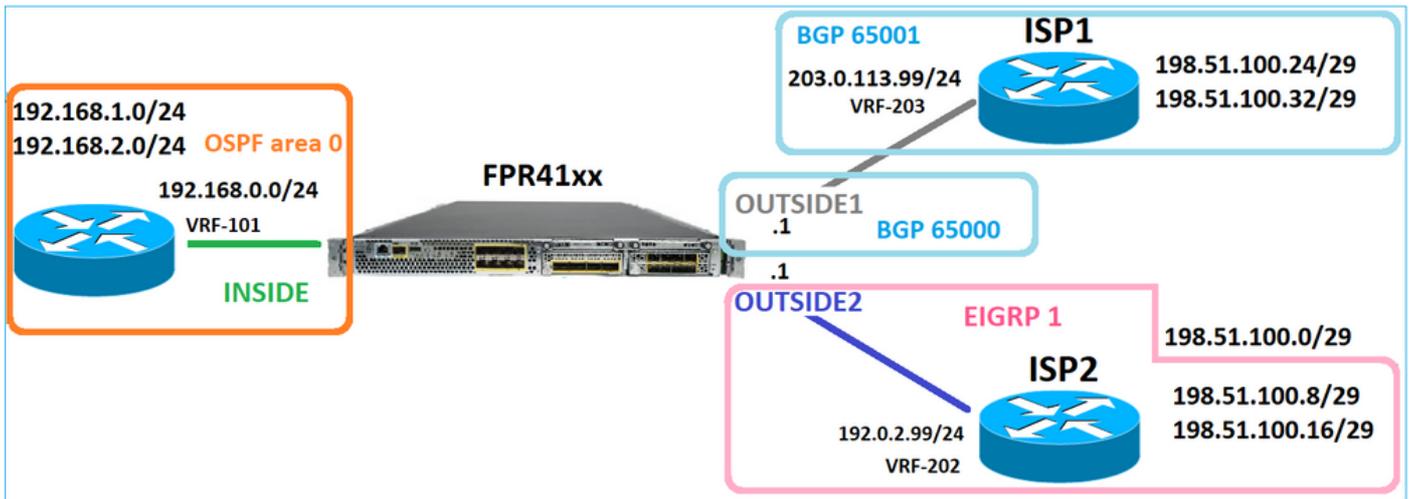

Ordre des opérations FTD

L'image montre l'ordre des opérations et l'endroit où les contrôles de routage ASP d'entrée et de sortie sont effectués :

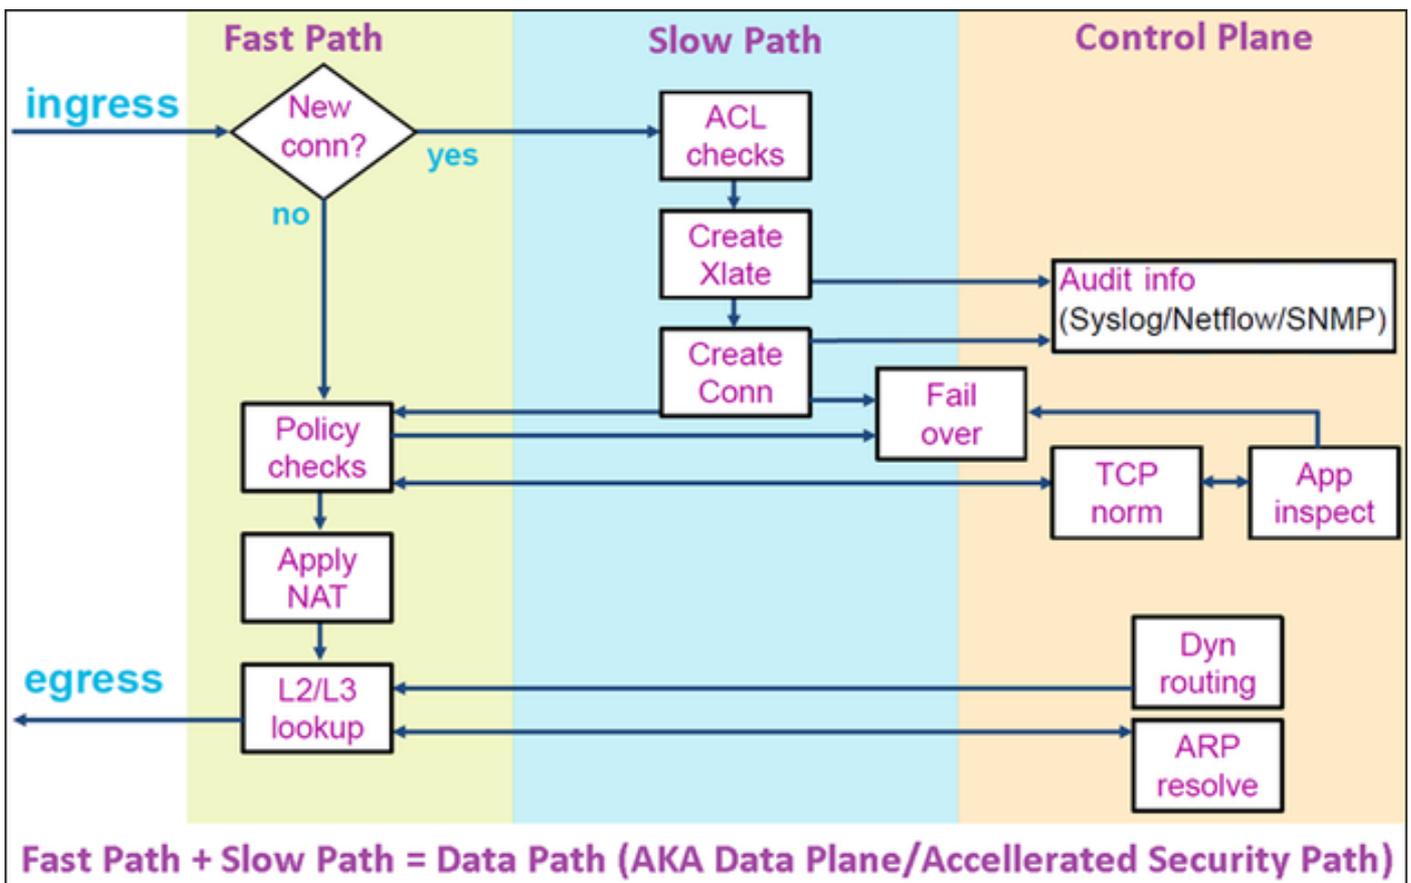

Configurer

Cas 1 - Transfert basé sur la recherche de connexion

Comme mentionné précédemment, le principal composant du moteur FTD LINA est le processus Datapath (plusieurs instances basées sur le nombre de coeurs de périphériques). En outre, le chemin de données (également appelé chemin de sécurité accéléré - ASP) se compose de 2 chemins :

1. Chemin lent = Responsable de l'établissement de la nouvelle connexion (il renseigne le chemin rapide).
2. Fast Path = gère les paquets qui appartiennent aux connexions établies.

- Les commandes telles que `show route` et `show arp` affichent le contenu du plan de contrôle.
- D'autre part, les commandes comme `show asp table routing` et `show asp table arp` affichent le contenu d'ASP (Datapath) qui est réellement appliqué.

Activez la capture avec trace sur l'interface FTD INSIDE :

```
firepower# capture CAPI trace detail interface INSIDE match ip host 192.168.1.1 host 198.51.100.1
```

Ouvrez une session Telnet via le FTD :

```
Router1# telnet 198.51.100.1 /vrf VRF-101 /source-interface lo1
Trying 198.51.100.1 ... Open
```

Les captures FTD montrent les paquets depuis le début de la connexion (la connexion TCP en trois étapes est capturée) :

```
firepower# show capture CAPI
```

26 packets captured

```
1: 10:50:38.407190 802.1Q vlan#101 PO 192.168.1.1.57734 > 198.51.100.1.23: S 1306692135:1306692135(0) w

Temporisation flottante

Le problème

Une instabilité de route temporaire peut entraîner l'établissement de connexions UDP (éléphantes) à longue durée de vie via le FTD par le biais d'interfaces FTD différentes de celles souhaitées.

La solution

Pour remédier à cela, définissez le délai d'attente « Floating-conn » sur une valeur différente de la valeur par défaut qui est désactivée :

Firewall Management Center
Devices / Platform Settings Editor

Overview Analysis Policies **Devices** Objects Integration

Dans le Guide de référence des commandes :

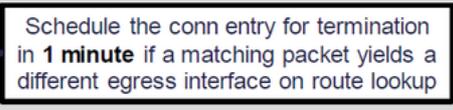

floating-conn	When multiple routes exist to a network with different metrics, the ASA uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To make it possible to use better routes, set the timeout to a value between 0:0:30 and 1193:0:0.
----------------------	--

Pour plus d'informations, consultez l'étude de cas : Échec des connexions UDP après rechargement à partir de la session CiscoLive BRKSEC-3020 :

Floating Connection Timeout

- The “bad” connection never times out since the UDP traffic is constantly flowing
 - TCP is stateful, so the connection would terminate and re-establish on its own
 - ASA needs to tear the original connection down when the corresponding route changes
 - ASA 8.4(2)+ introduces **timeout floating-conn** to accomplish this goal

```
asa# show run timeout
timeout xlate 9:00:00
timeout pat-xlate 0:00:30
timeout conn 1:00:00 half-closed 0:10:00 udp 0:02:00 icmp 0:00:02
timeout sunrpc 0:10:00 h323 0:05:00 h225 1:00:00 mgcp 0:05:00 mgcp-pat 0:05:00
timeout sip 0:30:00 sip_media 0:02:00 sip-invite 0:03:00 sip-disconnect 0:02:00
timeout sip-provisional-media 0:02:00 uauth 9:00:00 absolute uauth 0:01:00 inactivity
timeout tcp-proxy-reassembly 0:01:00
timeout floating-conn 0:00:00
asa#
asa# configure terminal
asa(config)# timeout floating-conn 0:01:00
```

Délai de retenue des appels

Le problème

Une route tombe en panne (elle est supprimée), mais le trafic correspond à une connexion établie.

La solution

La fonctionnalité de retenue de connexion a été ajoutée sur ASA 9.6.2. La fonctionnalité est activée par défaut, mais actuellement (7.1.x) n'est pas prise en charge par l'interface utilisateur FMC ou FlexConfig. Améliorations associées : [ENH : timeout conn-holddown not available for configuration in FMC](#)

Dans le guide ASA CLI :

conn-holddown	How long the system should maintain a connection when the route used by the connection no longer exists or is inactive. If the route does not become active within this holddown period, the connection is freed. The purpose of the connection holddown timer is to reduce the effect of route flapping, where routes might come up and go down quickly. You can reduce the holddown timer to make route convergence happen more quickly. The default is 15 seconds, the range is 00:00:00 to 00:00:15.
----------------------	--

```
firepower# show run all timeout
timeout xlate 3:00:00
timeout pat-xlate 0:00:30
timeout conn 1:00:00 half-closed 0:10:00 udp 0:02:00 sctp 0:02:00 icmp 0:00:02
timeout sunrpc 0:10:00 h323 0:05:00 h225 1:00:00 mgcp 0:05:00 mgcp-pat 0:05:00
timeout sip 0:30:00 sip_media 0:02:00 sip-invite 0:03:00 sip-disconnect 0:02:00
timeout sip-provisional-media 0:02:00 uauth 0:05:00 absolute
timeout tcp-proxy-reassembly 0:00:30
timeout floating-conn 0:00:00
timeout conn-holddown 0:00:15
timeout igp stale-route 0:01:10
```

Cas 2 - Transfert basé sur la recherche NAT

Exigence

Configurez cette règle NAT :

- Type : Statique
- Interface source : INSIDE
- Interface de destination : OUTSIDE1
- Source originale : 192.168.1.1
- Destination initiale : 198.51.100.1
- Source traduite : 192.168.1.1
- Destination traduite : 198.51.100.1

Solution

		Original Packet							Translated Packet				
#	Direction	Type	Source Interface Objects	Destination Interface Objects	Original Sources	Original Destinations	Original Services	Translated Sources	Translated Destinations	Translated Services	Options		
1		Static	INSIDE_FTD4100-1	OUTSIDE1_FTD4100	host_192.168.1.1	host_198.51.100.1		host_192.168.1.1	host_198.51.100.1		Dns: false		

La règle NAT déployée sur l'interface de ligne de commande FTD :

```
firepower# show run nat
nat (INSIDE,OUTSIDE1) source static host_192.168.1.1 host_192.168.1.1 destination static host_198.51.100.1
firepower# show nat
Manual NAT Policies (Section 1)
1 (INSIDE) to (OUTSIDE1) source static host_192.168.1.1 host_192.168.1.1 destination static host_198.51.100.1
translate_hits = 0, untranslate_hits = 0
```

Configurez 3 captures :

```
firepower# capture CAPI trace detail interface INSIDE match ip host 192.168.1.1 host 198.51.100.1
firepower# capture CAPO1 interface OUTSIDE1 match ip host 192.168.1.1 any
firepower# capture CAPO2 interface OUTSIDE2 match ip host 192.168.1.1 any
firepower# show capture
capture CAPI type raw-data trace detail interface INSIDE [Capturing - 0 bytes]
match ip host 192.168.1.1 host 198.51.100.1
capture CAPO1 type raw-data interface OUTSIDE1 [Capturing - 0 bytes]
```

```
match ip host 192.168.1.1 any
capture CAP02 type raw-data interface OUTSIDE2 [Capturing - 0 bytes]
match ip host 192.168.1.1 any
```

Lancez une session Telnet de 192.168.1.1 à 198.51.100.1 :

```
Router1# telnet 198.51.100.1 /vrf VRF-101 /source-interface lo1
Trying 198.51.100.1 ...
% Connection timed out; remote host not responding
```

Les paquets arrivent sur FTD, mais rien ne sort des interfaces OUTSIDE1 ou OUTSIDE2 :

```
firepower# show capture
capture CAPI type raw-data trace detail interface INSIDE [Capturing - 156 bytes]
match ip host 192.168.1.1 host 198.51.100.1
capture CAP01 type raw-data interface OUTSIDE1 [Capturing - 0 bytes]
match ip host 192.168.1.1 any
capture CAP02 type raw-data interface OUTSIDE2 [Capturing - 0 bytes]
match ip host 192.168.1.1 any
```

Suivez le paquet TCP SYN. La phase 3 (UN-NAT) montre que NAT (UN-NAT en particulier) a renvoyé le paquet vers l'interface OUTSIDE1 pour la recherche de tronçon suivant :

```
firepower# show capture CAPI
2 packets captured
1: 11:22:59.179678 802.1Q vlan#101 PO 192.168.1.1.38790 > 198.51.100.1.23: S 1174675193:1174675193(0) w

Drop-reason: (no-adjacency) No valid adjacency, Drop-location: frame 0x00005577204a7287 flow (NA)/NA

1 packet shown

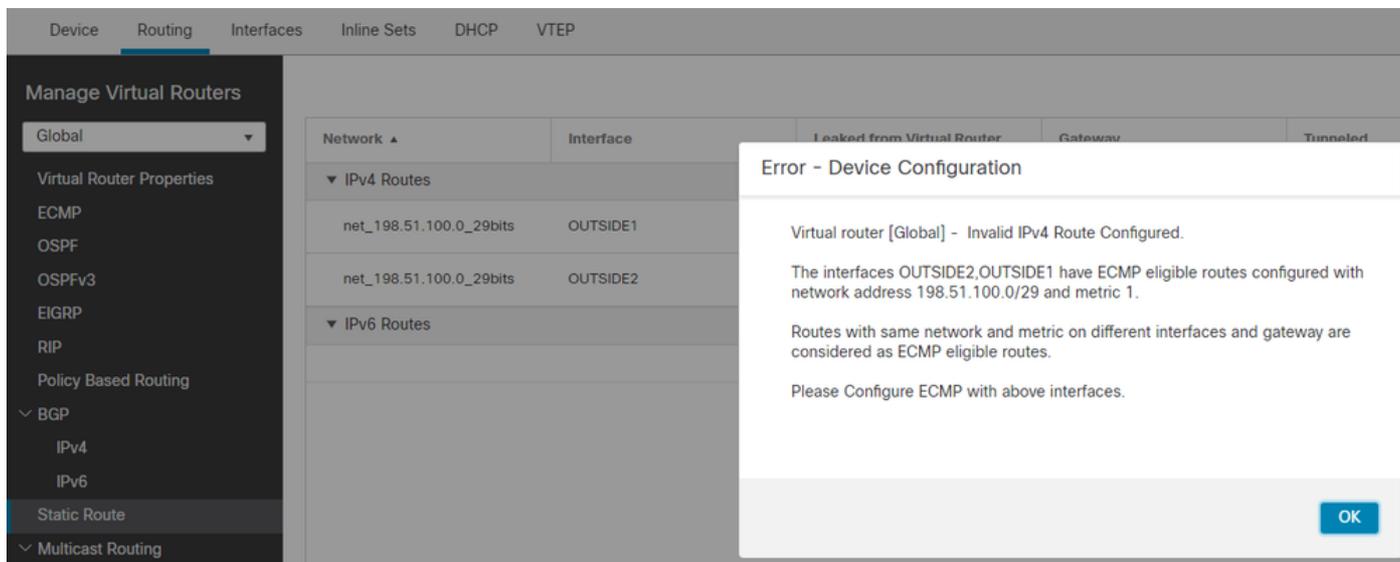

Dans ce cas, la fonction SUBOPTIMAL-LOOKUP signifie que l'interface de sortie déterminée par le processus NAT (OUTSIDE1) est différente de l'interface de sortie spécifiée dans la table d'entrée ASP :

```
firepower# show asp table routing | include 198.51.100.0
in 198.51.100.0 255.255.255.248 via 192.0.2.99, OUTSIDE2
out 198.51.100.0 255.255.255.248 via 192.0.2.99, OUTSIDE2
```

Une solution de contournement possible consiste à ajouter une route statique flottante sur l'interface OUTSIDE1 :

```
firepower# show run route
route OUTSIDE2 198.51.100.0 255.255.255.248 192.0.2.99 1
route OUTSIDE1 198.51.100.0 255.255.255.248 203.0.113.99 200
```

 Remarque : si vous tentez d'ajouter une route statique avec la même métrique que celle qui existe déjà, cette erreur apparaît :

Network	Interface	Leaked from Virtual Router	Gateway	Tunneled
IPv4 Routes				
net_198.51.100.0_29bits	OUTSIDE1			
net_198.51.100.0_29bits	OUTSIDE2			
IPv6 Routes				

 Remarque : une route flottante avec une métrique de distance de 255 n'est pas installée dans la table de routage.

Essayez d'établir une connexion Telnet avec les paquets envoyés via le FTD :

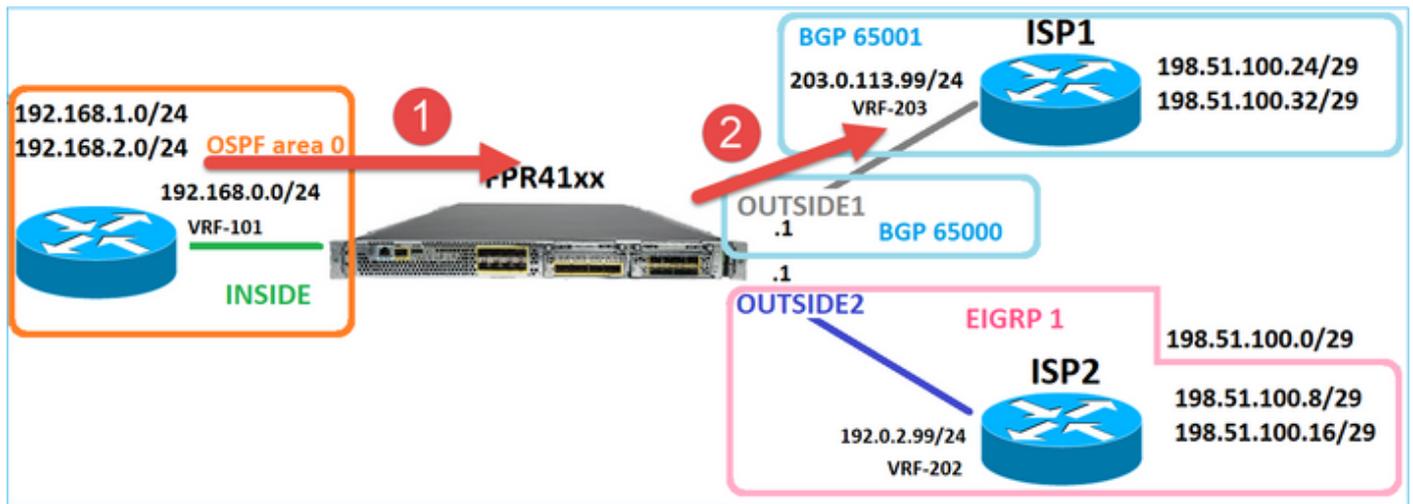

```
Router1# telnet 198.51.100.1 /vrf VRF-101 /source-interface lo1
Trying 198.51.100.1 ...
% Connection timed out; remote host not responding
```

```

firepower# show capture
capture CAPI type raw-data trace detail interface INSIDE [Capturing - 156 bytes]
match ip host 192.168.1.1 host 198.51.100.1
capture CAP01 type raw-data interface OUTSIDE1 [Capturing - 312 bytes]
match ip host 192.168.1.1 any
capture CAP02 type raw-data interface OUTSIDE2 [Capturing - 386 bytes]
match ip host 192.168.1.1 any

```

Packet trace indique que les paquets sont transférés vers l'interface ISP1 (OUTSIDE1) au lieu d'ISP2 en raison de la recherche NAT :

```

firepower# show capture CAPI packet-number 1 trace

```

2 packets captured

```

```

Cas 3 - Transfert basé sur le routage basé sur les politiques (PBR)

Après la recherche du flux de connexion et la recherche NAT de destination, PBR est l'élément suivant qui peut influencer la détermination de l'interface de sortie. PBR est documenté dans :

[Routage basé sur des politiques](#)

Pour la configuration PBR sur FMC, il est important de connaître cette directive :

FlexConfig a été utilisé pour configurer PBR dans FMC pour les versions FTD antérieures à 7.1.

Vous pouvez toujours utiliser FlexConfig pour configurer PBR dans toutes les versions.

Cependant, pour une interface d'entrée, vous ne pouvez pas configurer PBR à l'aide de FlexConfig et de la page Policy Based Routing de FMC.

Dans cette étude de cas, le FTD dispose d'une route vers 198.51.100.0/24 qui pointe vers ISP2 :

```
firepower# show route | begin Gate
```

```
Gateway of last resort is not set
```

```
C 192.0.2.0 255.255.255.0 is directly connected, OUTSIDE2
```

```
L 192.0.2.1 255.255.255.255 is directly connected, OUTSIDE2
```

```
C 192.168.0.0 255.255.255.0 is directly connected, INSIDE
```

```

```

```
B 198.51.100.32 255.255.255.248 [20/0] via 203.0.113.99, 5d00h
```

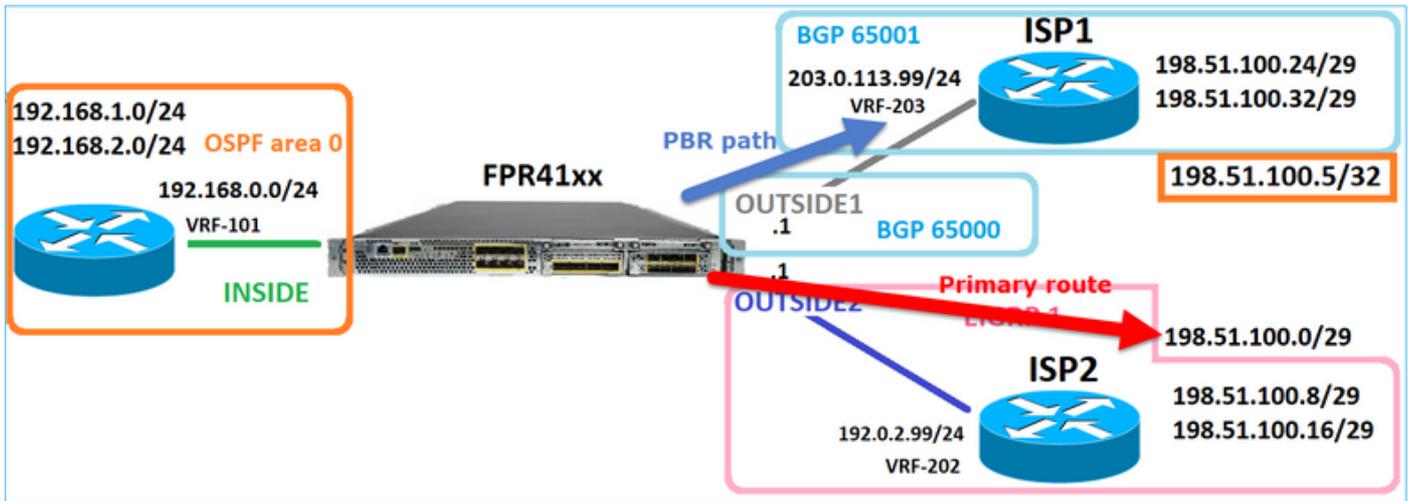

```
C 203.0.113.0 255.255.255.0 is directly connected, OUTSIDE1
```

```
L 203.0.113.1 255.255.255.255 is directly connected, OUTSIDE1
```

Exigence

Configurez une stratégie PBR avec les caractéristiques suivantes :

- Le trafic provenant de l'adresse IP 192.168.2.0/24 et destiné à l'adresse 198.51.100.5 doit être envoyé à ISP1 (tronçon suivant 203.0.113.99), tandis que les autres sources doivent utiliser l'interface OUTSIDE2.

Solution

Dans les versions antérieures à la version 7.1, pour configurer PBR :

1. Créez une liste de contrôle d'accès étendue correspondant au trafic intéressant (par exemple, PBR_ACL).
2. Créez une route-map correspondant à la liste de contrôle d'accès créée à l'étape 1, puis définissez le tronçon suivant souhaité.
3. Créez un objet FlexConfig qui active PBR sur l'interface d'entrée à l'aide de la carte de routage créée à l'étape 2.

Dans les versions postérieures à la version 7.1, vous pouvez configurer PBR de la manière antérieure à la version 7.1, ou vous pouvez utiliser la nouvelle option Policy Based Routing sous Device > Routing :

1. Créez une liste de contrôle d'accès étendue correspondant au trafic intéressant (par exemple, PBR_ACL).
2. Ajoutez une stratégie PBR et spécifiez :
 - a. Le trafic correspondant
 - b. L'interface d'entrée
 - c. Le tronçon suivant

Configurer PBR (nouvelle méthode)

Étape 1 : définition d'une liste d'accès pour le trafic correspondant

Firewall Management Center
Objects / Object Management

Overview Analysis Policies Devices **Objects** Integration

AAA Server
Access List
Extended
Standard
Address Pools
Application Filters
AS Path
Cipher Suite List
Community List
Distinguished Name
DNS Server Group
External Attributes
File List

Extended
An access list object, also known as an access control list (ACL), selects the traffic to which a service will apply. Standard-Identifies traffic based on destination address only. Identifies traffic based on source and destination addresses. Supports IPv4 and IPv6.

Edit Extended Access List Object

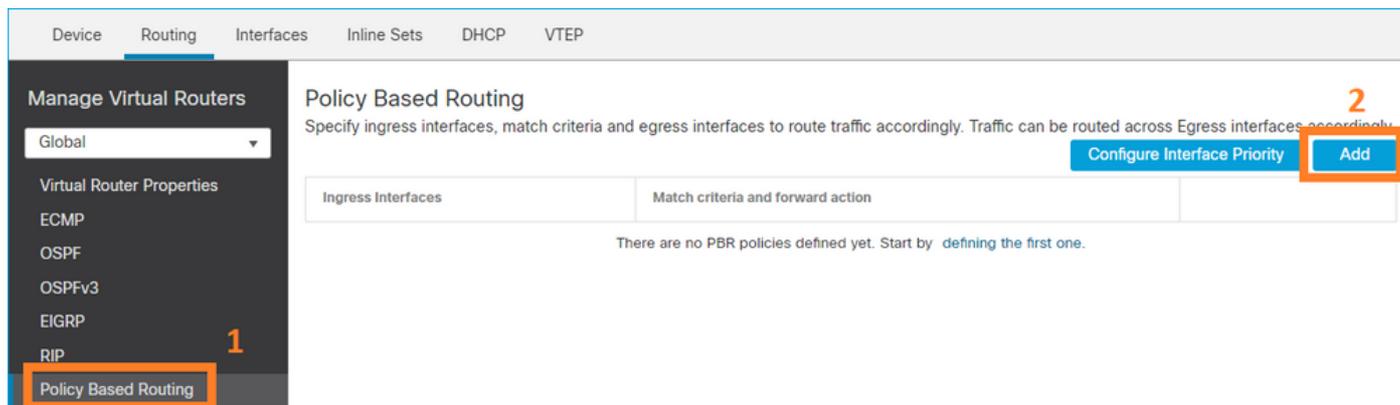

Name
ACL_PBR

Entries (1)

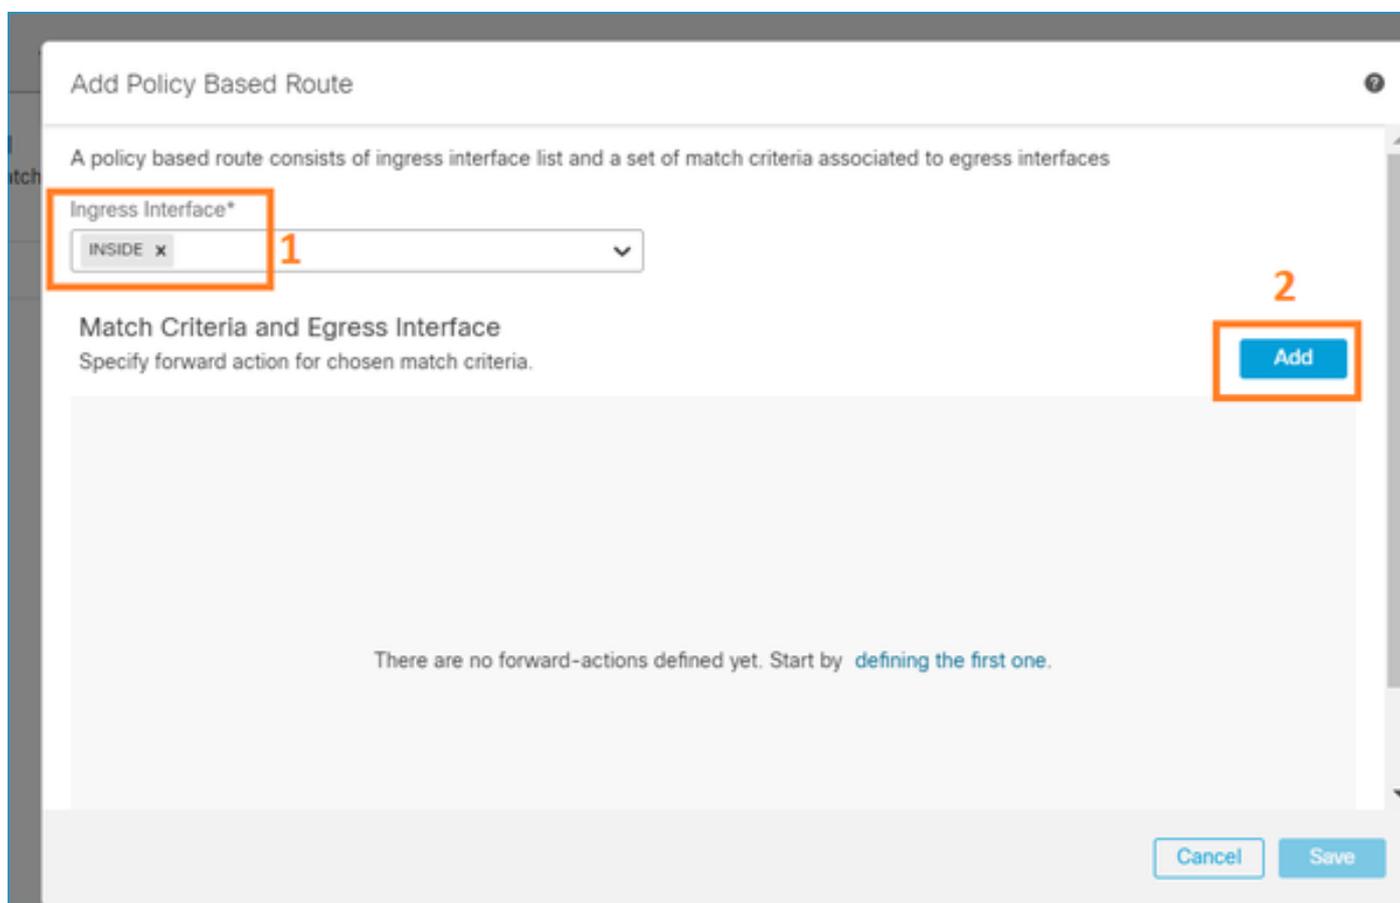

Sequence	Action	Source	Source Port	Destination	Destination Port	Application
1	Allow	192.168.2.0/24	Any	198.51.100.5	Any	Any

Étape 2 : ajout d'une stratégie PBR

Accédez à Devices > Device Management et modifiez le périphérique FTD. Choisissez Routing > Policy Based Routing, et sur la page Policy Based Routing, sélectionnez Add.

Spécifiez l'interface d'entrée :

Spécifiez les actions de transfert :

Add Forwarding Actions

Match ACL:* 1

Send To:* 2

IPv4 Addresses 3

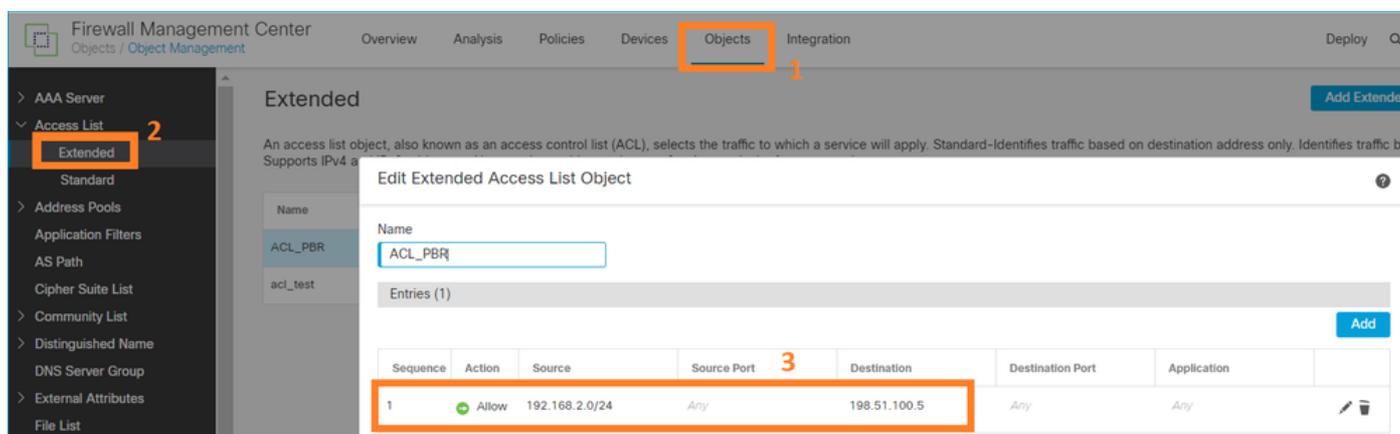

IPv6 Addresses

Enregistrer et déployer

 Remarque : si vous voulez configurer plusieurs interfaces de sortie, vous devez définir dans le champ 'Send To' l'option 'Egress Interfaces' (disponible depuis la version 7.0+). Pour plus de détails, consultez : [Exemple de configuration du routage basé sur des stratégies](#)

Configurer PBR (méthode héritée)

Étape 1 : définition d'une liste d'accès pour le trafic correspondant

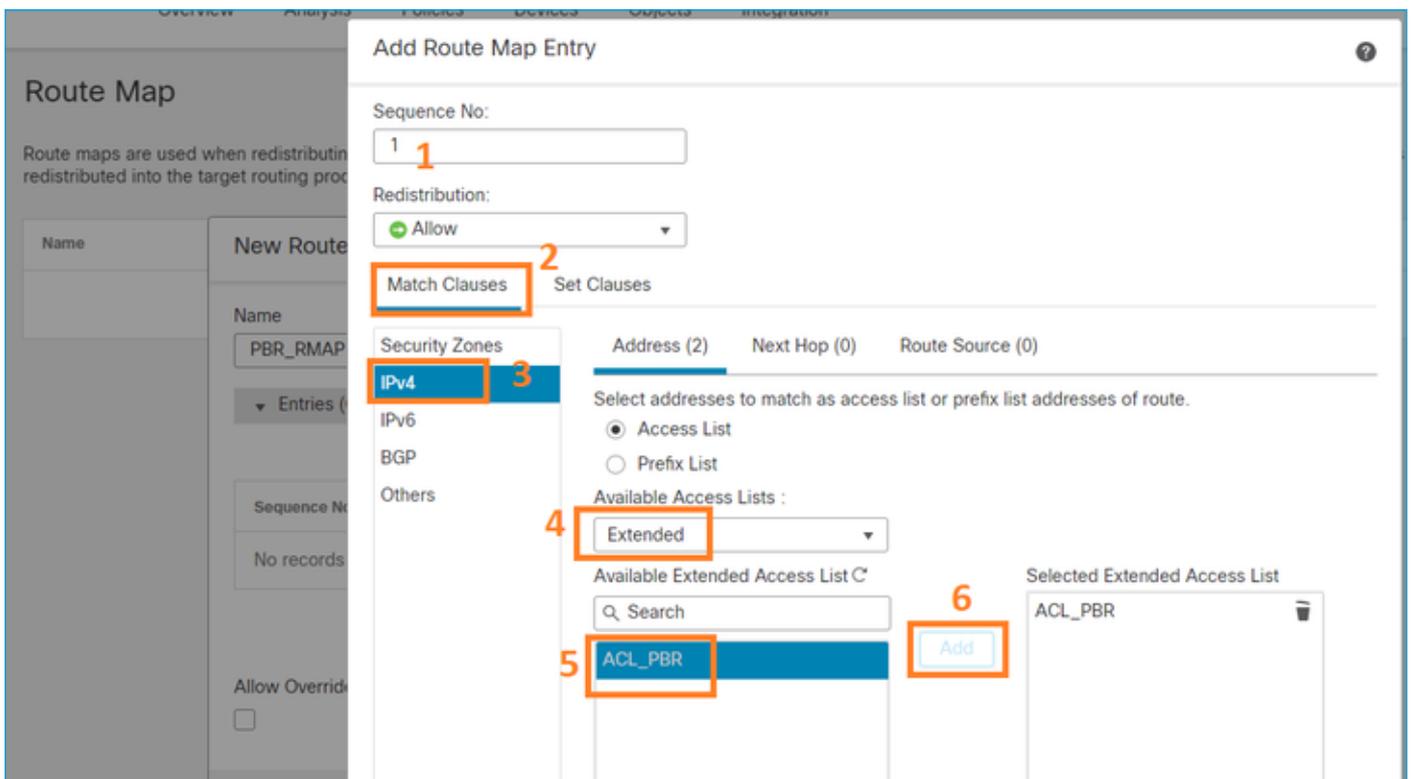

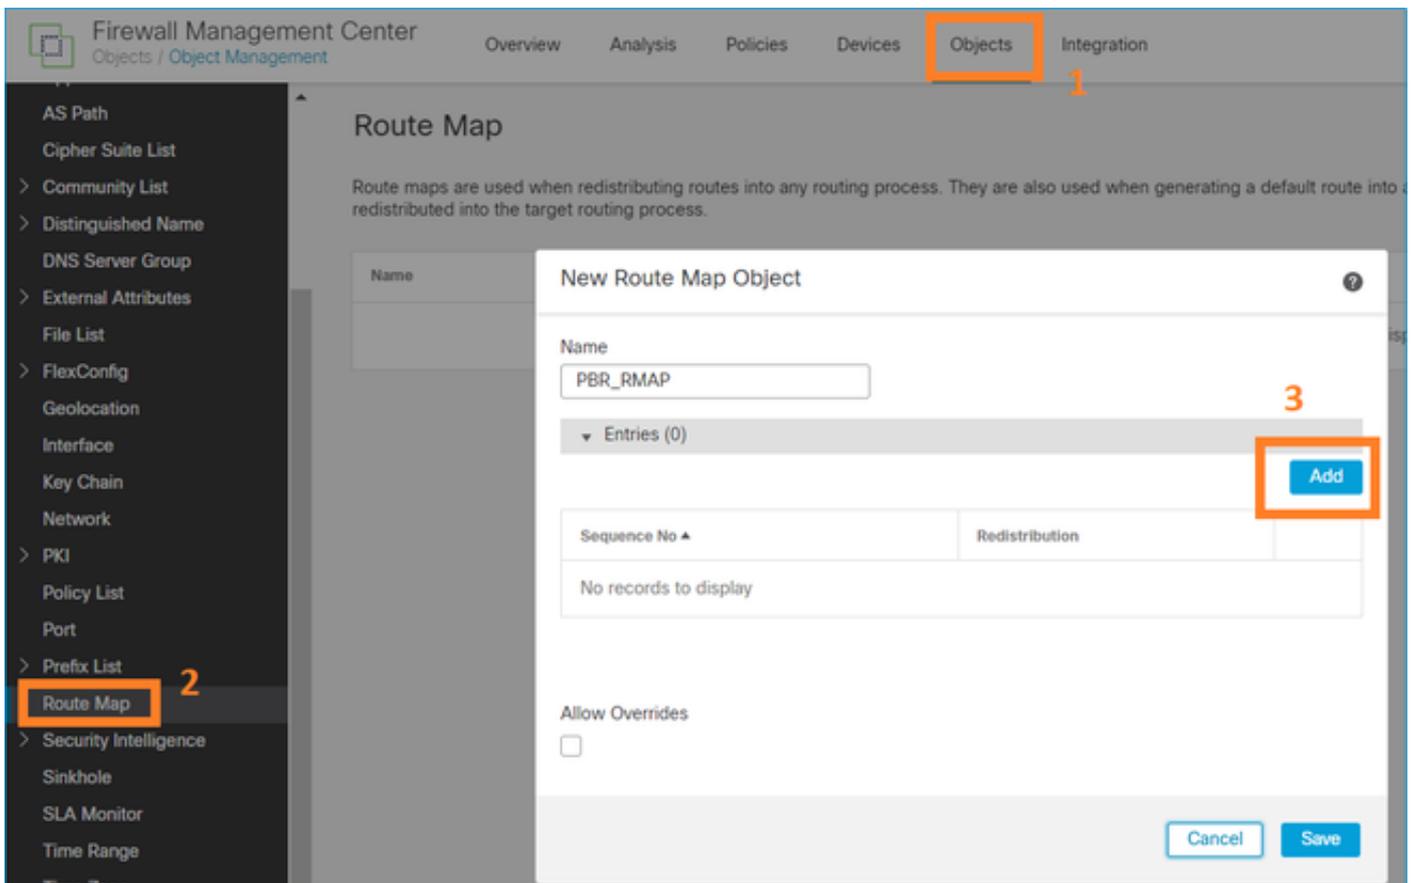

The screenshot shows the Firewall Management Center interface. The 'Objects' tab is selected. In the left sidebar, 'Access List' > 'Extended' is highlighted. The main area shows the 'Edit Extended Access List Object' dialog for 'ACL_PBR'. The 'Name' field contains 'ACL_PBR'. Below, there is a table with one entry:

Sequence	Action	Source	Source Port	Destination	Destination Port	Application
1	Allow	192.168.2.0/24	Any	198.51.100.5	Any	Any

Étape 2 : définition d'une route-map correspondant à la liste de contrôle d'accès et définition du tronçon suivant

Définissez d'abord la clause Match :

Définissez la clause Set :

Edit Route Map Entry

Sequence No:

Redistribution:

Match Clauses **Set Clauses** 1

!INTERFACE_END

###Flex-config Appended CLI###
interface Port-channel1.101
policy-route route-map PBR_RMAP
```

Enfin, déployez la stratégie.

 Remarque : PBR ne peut pas être configuré avec FlexConfig et l'interface utilisateur FMC pour la même interface d'entrée.

Pour la configuration du SLA de PBR, consultez ce document : [Configure PBR with IP SLAs for DUAL ISP on FTD Managed by FMC](#)

Vérification PBR

Vérification de l'interface entrante :

```
firepower# show run interface Po1.101
!
interface Port-channel1.101
vlan 101
nameif INSIDE
cts manual
propagate sgt preserve-untag
policy static sgt disabled trusted
security-level 0
ip address 192.168.0.1 255.255.255.0
policy-route route-map FMC_GENERATED_PBR_1649228271478
ospf authentication null
```

Vérification de la carte de routage :

```
firepower# show run route-map
!
route-map FMC_GENERATED_PBR_1649228271478 permit 5
 match ip address ACL_PBR
 set ip next-hop 203.0.113.99
```

```
firepower# show route-map
route-map FMC_GENERATED_PBR_1649228271478, permit, sequence 5
Match clauses:
ip address (access-lists): ACL_PBR

Set clauses:
adaptive-interface cost OUTSIDE1 (0)
```

Vérification du routage de la politique :

```
firepower# show policy-route
Interface Route map
Port-channel1.101 FMC_GENERATED_PBR_1649228271478
```

Packet-Tracer avant et après la modification :

Sans PBR	Avec PBR

Time Taken: 222106 ns

Le tableau ASP PBR indique le nombre de succès de la stratégie :

```
firepower# show asp table classify domain pbr
```

Input Table

in id=0x1505f26d3420, priority=2147483642, domain=pbr, deny=false

hits=7, user_data=0x1505f26e7590, cs_id=0x0, use_real_addr, flags=0x0, protocol=0

src ip/id=192.168.2.0, mask=255.255.255.0, port=0, tag=any

dst ip/id=198.51.100.5, mask=255.255.255.255, port=0, tag=any, dscp=0x0, nsg_id=none

input_ifc=INSIDE(vrfid:0), output_ifc=any

Output Table:

L2 - Output Table:

L2 - Input Table:

Last clearing of hits counters: Never

 Remarque : le traceur de paquets augmente également le compteur de succès.

Débogage PBR

 Avertissement : dans un environnement de production, le débogage peut produire beaucoup de messages.

Activez ce débogage :

```
firepower# debug policy-route
debug policy-route enabled at level 1
```

Envoyer le trafic réel :

```
Router1# telnet 198.51.100.5 /vrf VRF-101 /source-interface lo2
Trying 198.51.100.5 ... Open
```

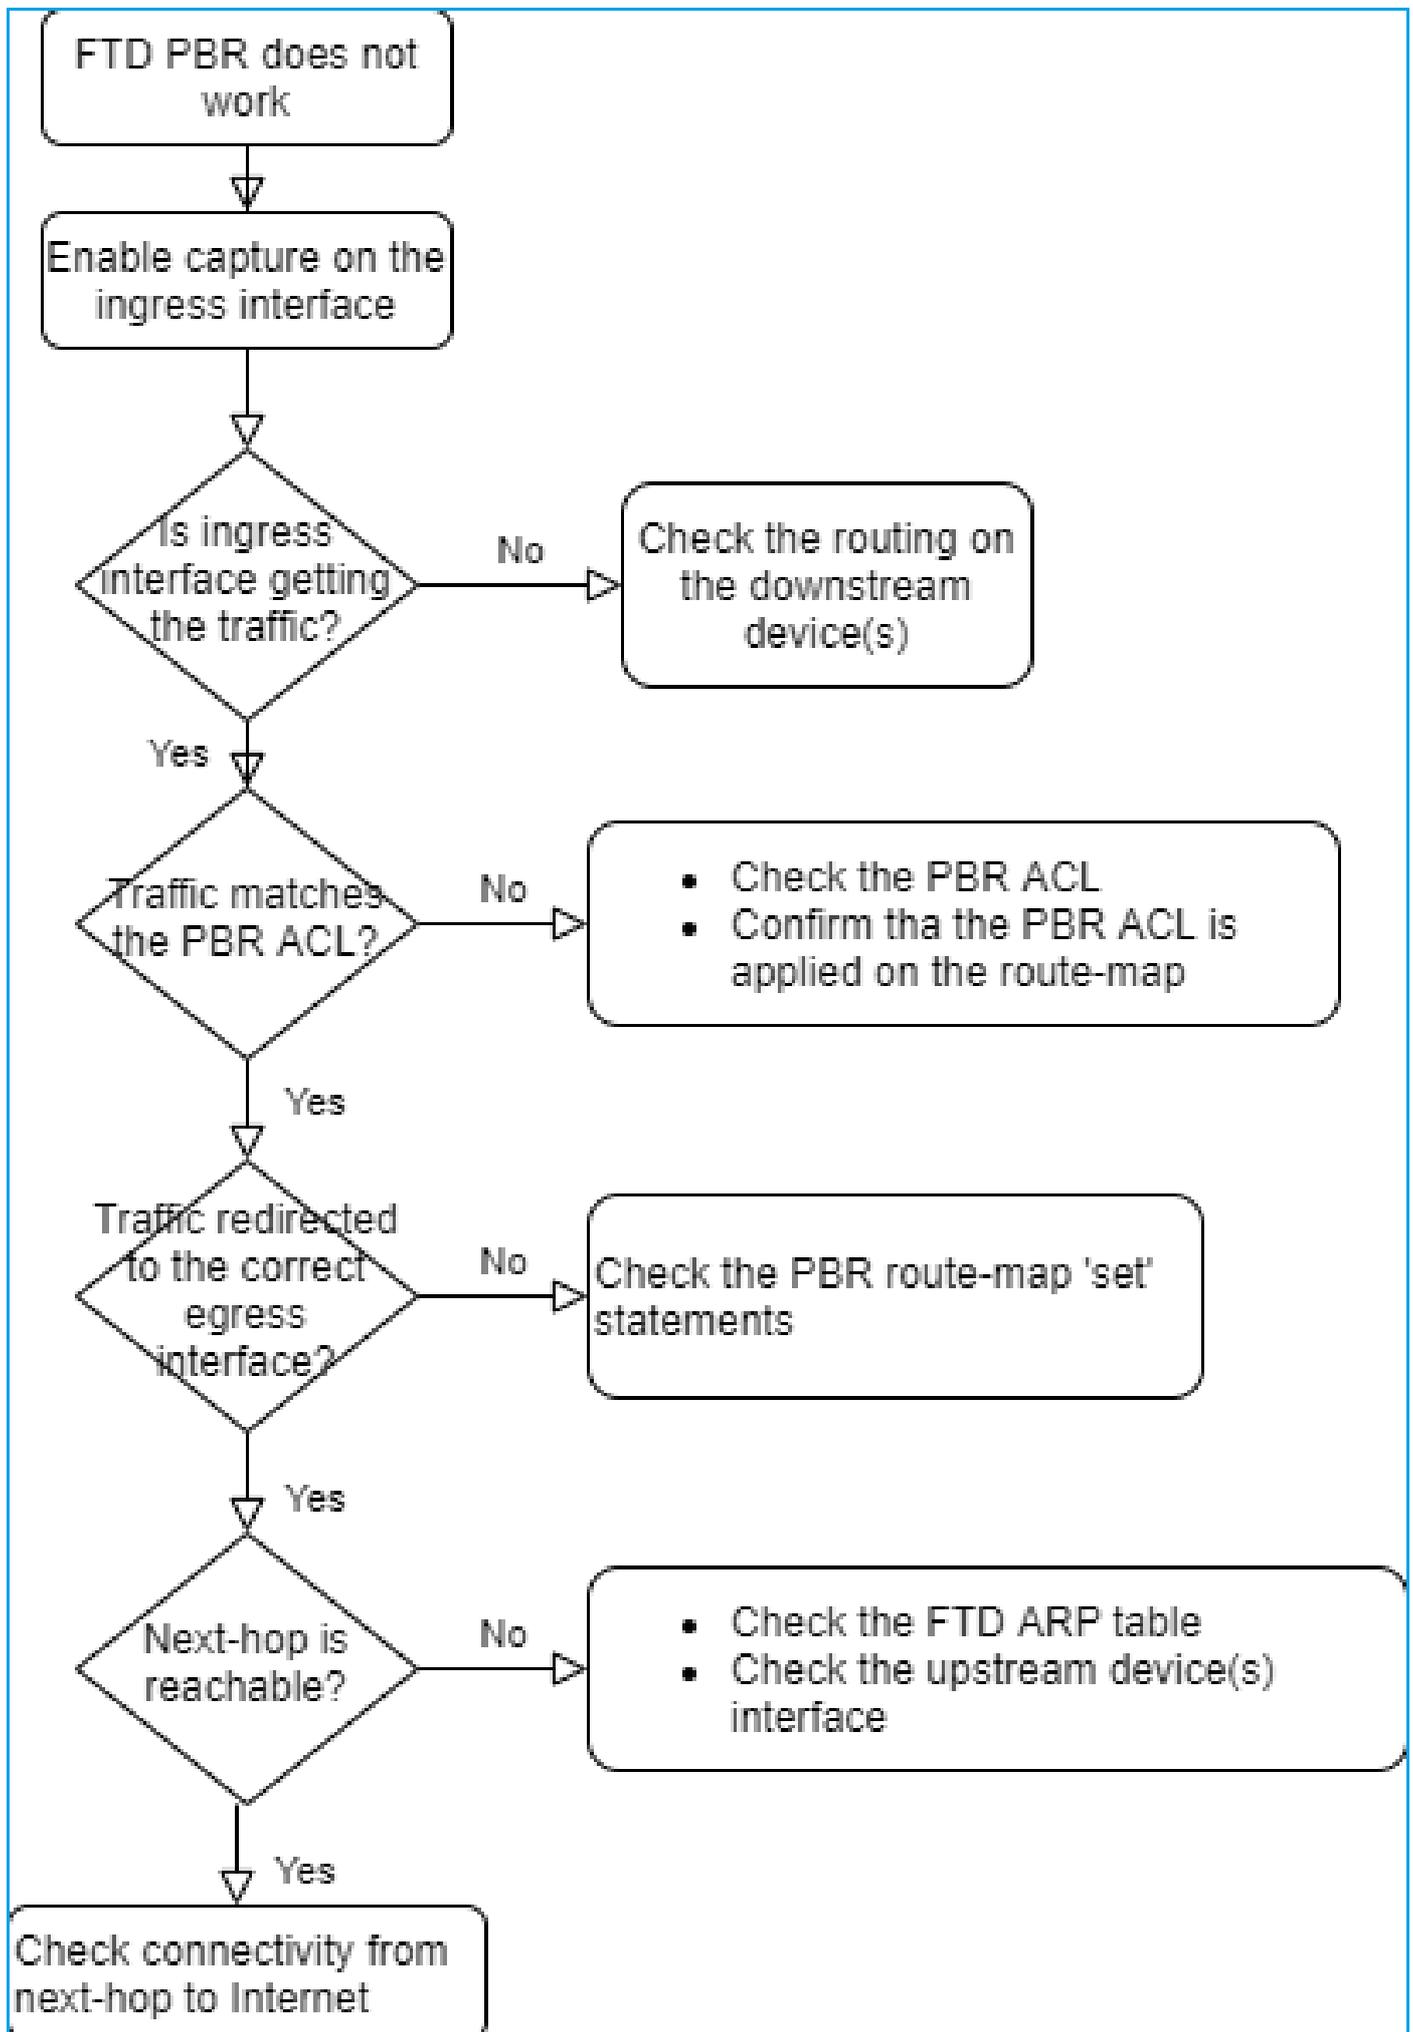

Le débogage indique :

```
firepower#
```

```
pbr: policy based route lookup called for 192.168.2.1/37256 to 198.51.100.5/23 proto 6 sub_proto 0 rece
pbr: First matching rule from ACL(2)
pbr: route map FMC_GENERATED_PBR_1649228271478, sequence 5, permit; proceed with policy routing
pbr: policy based routing applied; egress_ifc = OUTSIDE1 : next_hop = 203.0.113.99
```

 Remarque : Packet-tracer génère également une sortie de débogage.

Cet organigramme peut être utilisé pour dépanner PBR :

show asp drop

Cas 4 - Transfert basé sur la recherche de routage globale

Après la recherche de connexion, la recherche NAT et PBR, le dernier élément qui est vérifié pour déterminer l'interface de sortie est la table de routage globale.

Vérification de la table de routage

Examinons le résultat d'une table de routage FTD :

```
firepower# show route

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, V - VPN
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route, + - replicated route
       SI - Static InterVRF, BI - BGP InterVRF
Gateway of last resort is not set

Dest. Mask  Dest. Network  Administrative Distance  Metric  Next Hop
-----
C 192.0.2.0 255.255.255.0 is directly connected, OUTSIDE2
L 192.0.2.1 255.255.255.255 is directly connected, OUTSIDE2
C 192.168.0.0 255.255.255.0 is directly connected, INSIDE
L 192.168.0.1 255.255.255.255 is directly connected, INSIDE
O 192.168.1.1 255.255.255.255
  [110/11] via 192.168.0.99, 01:36:53, INSIDE
O 192.168.2.1 255.255.255.255
  [110/11] via 192.168.0.99, 01:36:53, INSIDE
S 198.51.100.0 255.255.255.248 [1/0] via 192.0.2.99, OUTSIDE2
D 198.51.100.8 255.255.255.248
  [90/128512] via 192.0.2.99, 15:13:23, OUTSIDE2
D 198.51.100.16 255.255.255.248
  [90/128512] via 192.0.2.99, 15:13:23, OUTSIDE2
B 198.51.100.24 255.255.255.248 [20/0] via 203.0.113.99, 15:13:26
B 198.51.100.32 255.255.255.248 [20/0] via 203.0.113.99, 15:13:26
```

L'objectif principal du processus de routage est de trouver le saut suivant. La sélection de la route se fait dans l'ordre suivant :

1. Victoires du match le plus long
2. AD le plus bas (entre différentes sources de protocole de routage)
3. Métrique la plus basse (si les routes sont apprises à partir de la même source - protocole de routage)

Mode de remplissage de la table de routage :

- IGP (R, D, EX, O, IA, N1, N2, E1, E2, i, su, L1, L2, ia, o)
- BGP (B)
- BGP InterVRF (BI)
- Statique (S)
- InterVRF statique (SI)

- Connecté (C)
- IP locales (L)
- VPN (V)
- Redistribution
- Par défaut

Pour afficher le résumé de la table de routage, utilisez cette commande :

```
<#root>
```

```
firepower#
```

```
show route summary
```

```
IP routing table maximum-paths is 8
```

Route Source	Networks	Subnets	Replicates	Overhead	Memory (bytes)
connected	0	8	0	704	2368
static	0	1	0	88	296
ospf 1	0	2	0	176	600
Intra-area: 2 Inter-area: 0 External-1: 0 External-2: 0					
NSSA External-1: 0 NSSA External-2: 0					
bgp 65000	0	2	0	176	592
External: 2 Internal: 0 Local: 0					
eigrp 1	0	2	0	216	592
internal	7				3112
Total	7	15	0	1360	7560

Vous pouvez suivre les mises à jour de la table de routage avec cette commande :

```
<#root>
```

```
firepower#
```

```
debug ip routing
```

```
IP routing debugging is on
```

Par exemple, voici ce que le débogage montre lorsque la route OSPF 192.168.1.0/24 est supprimée de la table de routage globale :

```
<#root>
```

```
firepower#
```

```
RT: ip_route_delete 192.168.1.0 255.255.255.0 via 192.0.2.99, INSIDE
```

```
ha_cluster_synced 0 routetype 0
```

```
RT: del 192.168.1.0 via 192.0.2.99, ospf metric [110/11]NP-route: Delete-Output 192.168.1.0/24 hop_count:1
```

```
RT: delete network route to 192.168.1.0 255.255.255.0NP-route: Delete-Output 192.168.1.0/24 hop_count:1
```

```
NP-route: Delete-Input 192.168.1.0/24 hop_count:1 Distance:110 Flags:0X0 , via 0.0.0.0, INSIDE
```

Lors de son rajout :

```
<#root>
```

```
firepower#
```

```
RT: NP-route: Add-Output 192.168.1.0/24 hop_count:1 , via 192.0.2.99, INSIDE
```

```
NP-route: Add-Input 192.168.1.0/24 hop_count:1 Distance:110 Flags:0X0 , via 192.0.2.99, INSIDE
```

Interface Null0

L'interface Null0 peut être utilisée pour supprimer le trafic indésirable. Cette suppression a moins d'impact sur les performances que la suppression du trafic avec une règle de politique de contrôle d'accès (ACL).

Exigence

Configurez une route Null0 pour l'hôte 198.51.100.4/32.

Solution

The screenshot shows the Cisco Firepower configuration interface for FTD4100-1. The left sidebar shows the 'Static Route' option selected under the 'IPV6' section (marked with a red box and '1'). The main area displays the 'Add Static Route Configuration' dialog. The 'Interface*' dropdown is set to 'Null0' (marked with a red box and '2'). The 'Available Network' list contains 'host_198.51.100.4' (marked with a red box and '3'). The 'Add' button is highlighted (marked with a red box and '4'). The 'Selected Network' list is empty. The 'Gateway*' field is empty. The 'Metric' field is empty.

Enregistrer et déployer.

Vérification :

```
<#root>
```

```
firepower#
```

```
show run route
```

```
route OUTSIDE2 198.51.100.0 255.255.255.248 192.0.2.99 1
route OUTSIDE1 198.51.100.0 255.255.255.248 203.0.113.99 200
route Null0 198.51.100.4 255.255.255.255 1
```

```
<#root>
```

```
firepower#
```

```
show route | include 198.51.100.4
```

```
s 198.51.100.4 255.255.255.255 [1/0] is directly connected, Null0
```

Essayez d'accéder à l'hôte distant :

```
<#root>
```

```
Router1#
```

```
ping vrf VRF-101 198.51.100.4
```

```
Type escape sequence to abort.
```

```
Sending 5, 100-byte ICMP Echos to 198.51.100.4, timeout is 2 seconds:
```

```
.....
```

```
Success rate is 0 percent (0/5)
```

Les journaux FTD indiquent :

```
<#root>
```

```
firepower#
```

```
show log | include 198.51.100.4
```

Apr 12 2022 12:35:28:

%FTD-6-110002: Failed to locate egress interface for ICMP from INSIDE:192.168.0.99/0 to 198.51.100.4/0

Les abandons ASP montrent :

```
<#root>
```

```
firepower#
```

```
show asp drop
```

Frame drop:

```
No route to host (no-route)          1920
```

Protocole ECMP (Equal Cost Multi-Path)

Zones de trafic

- La zone de trafic ECMP permet à un utilisateur de regrouper des interfaces (appelée zone ECMP).
- Cela permet le routage ECMP ainsi que l'équilibrage de charge du trafic sur plusieurs interfaces.
- Lorsque des interfaces sont associées à la zone de trafic ECMP, l'utilisateur peut créer des routes statiques à coût égal à travers les interfaces. Les routes statiques à coût égal sont des routes vers le même réseau de destination avec la même valeur métrique.

Avant la version 7.1, Firepower Threat Defense prenait en charge le routage ECMP via des politiques FlexConfig. À partir de la version 7.1, vous pouvez regrouper des interfaces dans des zones de trafic et configurer le routage ECMP dans Firepower Management Center.

EMCP est documenté dans : [ECMP](#)

Dans cet exemple, il y a un routage asymétrique et le trafic de retour est abandonné :

```
<#root>
```

```
firepower#
```

```
show log
```

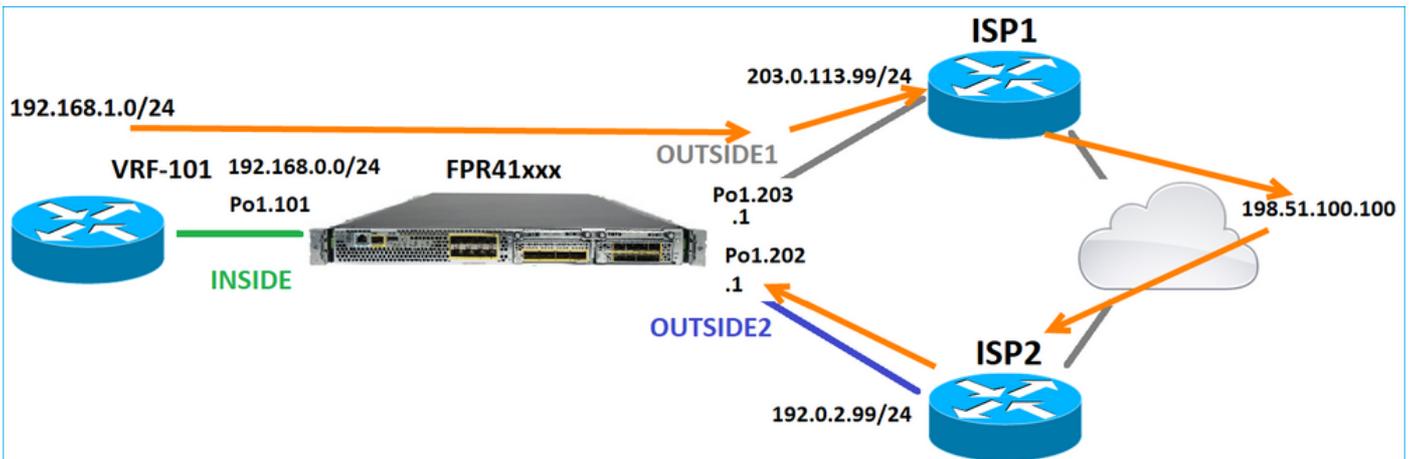

Apr 13 2022 07:20:48: %FTD-6-302013:

```
B
```

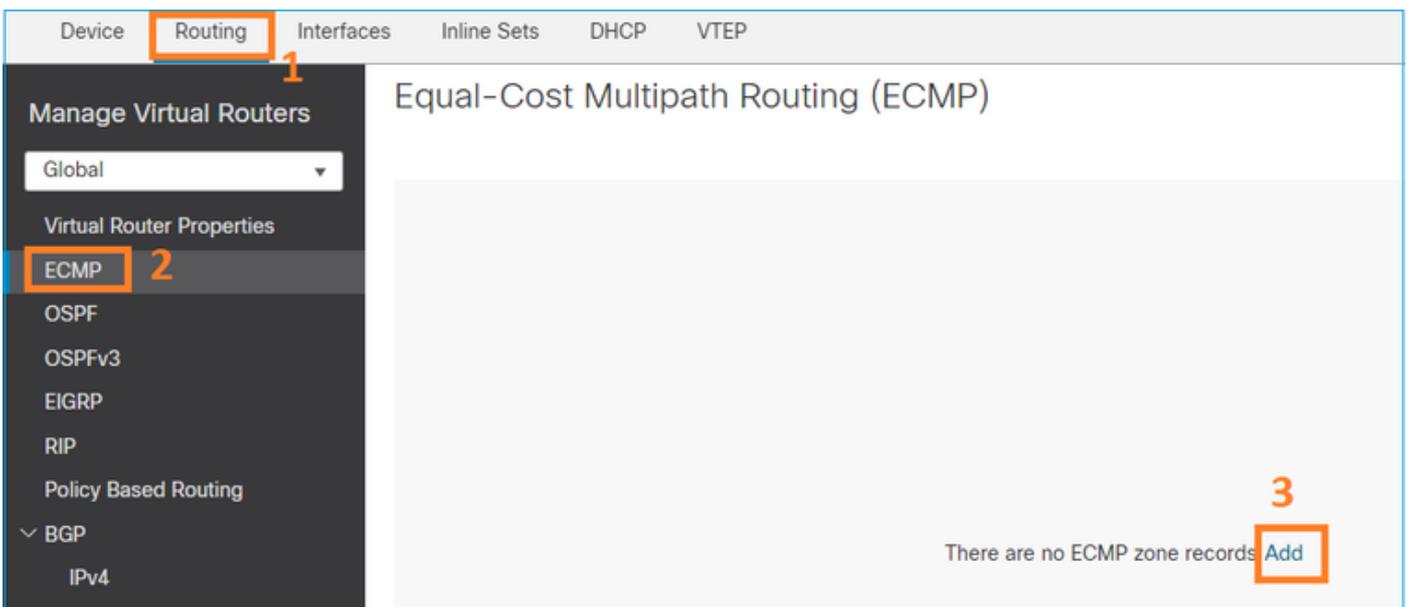

```
uilt inbound TCP connection 4046 for INSIDE:192.168.1.1/23943 (192.168.1.1/23943) to OUTSIDE1:198.51.100.4/0
```

Apr 13 2022 07:20:48: %FTD-6-106015:

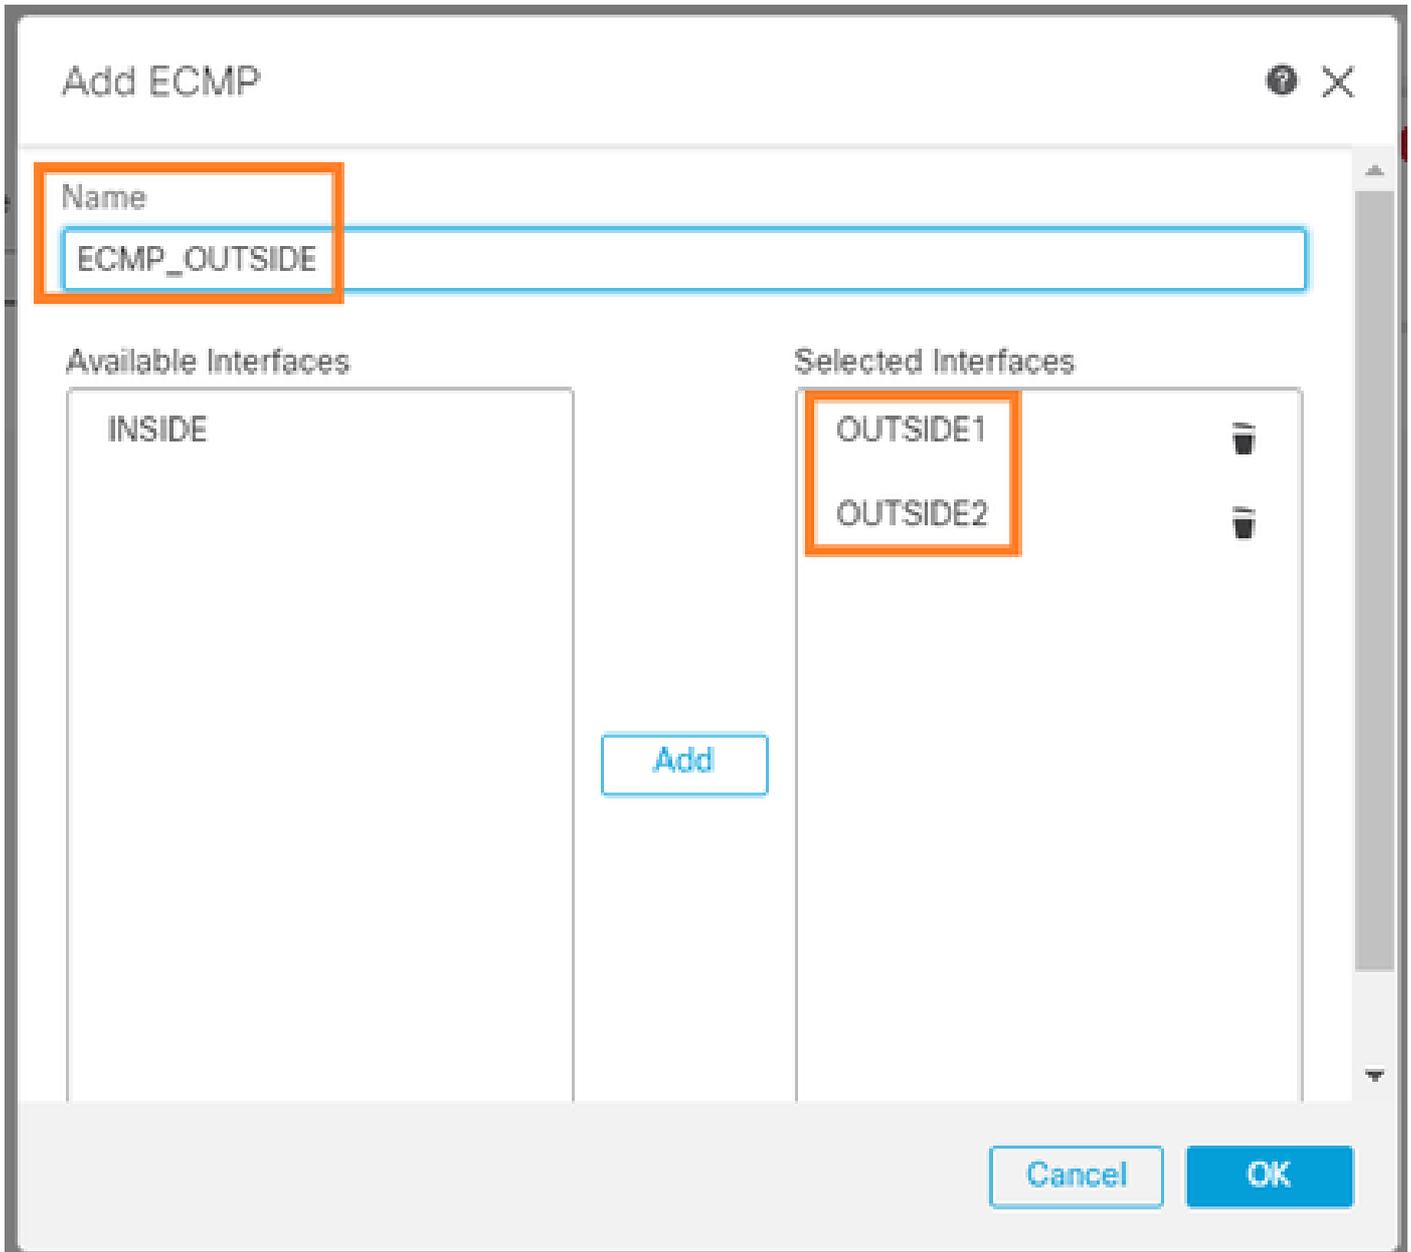

Deny TCP (no connection) from 198.51.100.100/23 to 192.168.1.1/23943 flags SYN ACK on interface OUTSIDE2

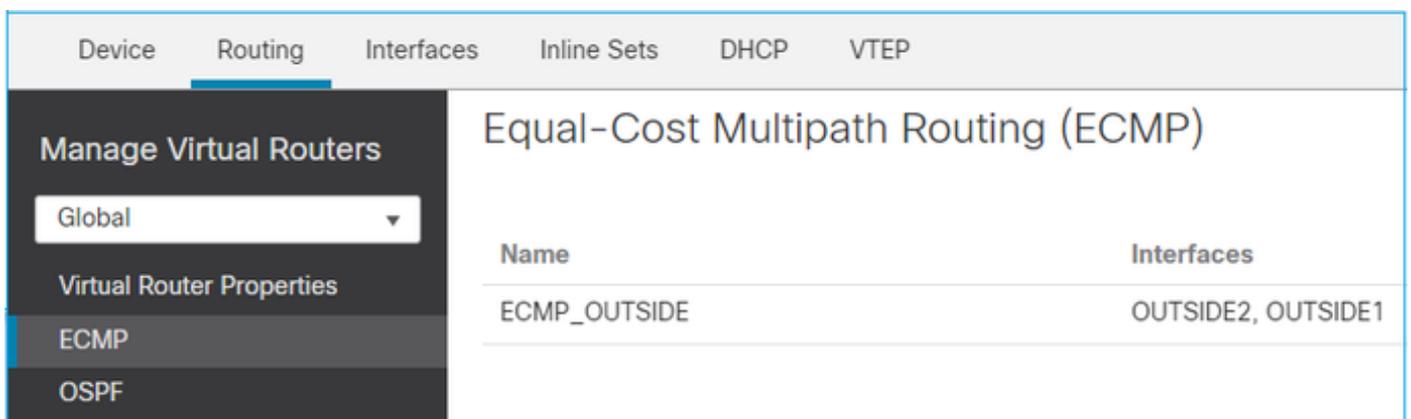

Configurez ECMP à partir de l'interface utilisateur FMC :

Ajoutez les 2 interfaces dans le groupe ECMP :

Le résultat :

Enregistrer et déployer.

Vérification de la zone ECMP :

<#root>

firepower#

show run zone

```
zone ECMP_OUTSIDE ecmp
```

firepower#

show zone

```
Zone: ECMP_OUTSIDE ecmp
```

```
Security-level: 0
```

```
Zone member(s): 2
```

```
OUTSIDE1 Port-channel1.203
```

```
OUTSIDE2 Port-channel1.202
```

Vérification des interfaces :

<#root>

firepower#

show run int po1.202

```
!  
interface Port-channel1.202  
vlan 202  
nameif OUTSIDE2  
cts manual  
propagate sgt preserve-untag  
policy static sgt disabled trusted  
security-level 0
```

```
zone-member ECMP_OUTSIDE
```

```
ip address 192.0.2.1 255.255.255.0
```

firepower#

show run int po1.203

```
!  
interface Port-channel1.203  
vlan 203  
nameif OUTSIDE1  
cts manual  
propagate sgt preserve-untag  
policy static sgt disabled trusted  
security-level 0  
  
zone-member ECMP_OUTSIDE  
  
ip address 203.0.113.1 255.255.255.0
```

Maintenant, le trafic de retour est autorisé et la connexion est UP :

```
<#root>  
Router1#  
telnet 198.51.100.100 /vrf VRF-101 /source-interface lo1  
  
Trying 198.51.100.100 ... Open
```

La capture sur l'interface ISP1 affiche le trafic de sortie :

```
<#root>  
firepower#  
show capture CAP1  
  
5 packets captured  
1: 10:03:52.620115 802.1Q vlan#203 PO 192.168.1.1.56199 > 198.51.100.100.23: S 1782458734:1782458734(0)

Plan de gestion FTD

Le FTD dispose de 2 plans de gestion :

- Interface Management0 - Permet d'accéder au sous-système Firepower
- Interface de diagnostic LINA - Fournit un accès au sous-système LINA FTD

Pour configurer et vérifier l'interface Management0, utilisez respectivement les commandes configure network et show network.

D'autre part, les interfaces LINA fournissent un accès à la LINA elle-même. Les entrées d'interface FTD dans le RIB FTD peuvent être considérées comme des routes locales :

```
<#root>
```

```
firepower#
```

```
show route | include L
```

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP

i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2

```
L 192.0.2.1 255.255.255.255 is directly connected, OUTSIDE2
```

```
L 192.168.0.1 255.255.255.255 is directly connected, INSIDE
```

```
L 203.0.113.1 255.255.255.255 is directly connected, OUTSIDE1
```

De même, elles peuvent être vues comme des entrées d'identité dans la table de routage ASP :

```
<#root>
```

```
firepower#
```

```
show asp table routing | include identity
```

```
in 169.254.1.1 255.255.255.255 identity
```

```
in
```

```
192.0.2.1 255.255.255.255 identity
```

```
in
203.0.113.1 255.255.255.255 identity
```

```
in
192.168.0.1 255.255.255.255 identity
```

```
in ff02::1 ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff identity
in ff02::1:ff01:3 ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff identity
in ff02::1:ff00:1 ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff identity
in fe80::200:ff:fe01:3 ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff identity
in fd00:0:0:1::1 ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff identity
out 0.0.0.0 0.0.0.0 via 0.0.0.0, identity
out :: :: via 0.0.0.0, identity
```

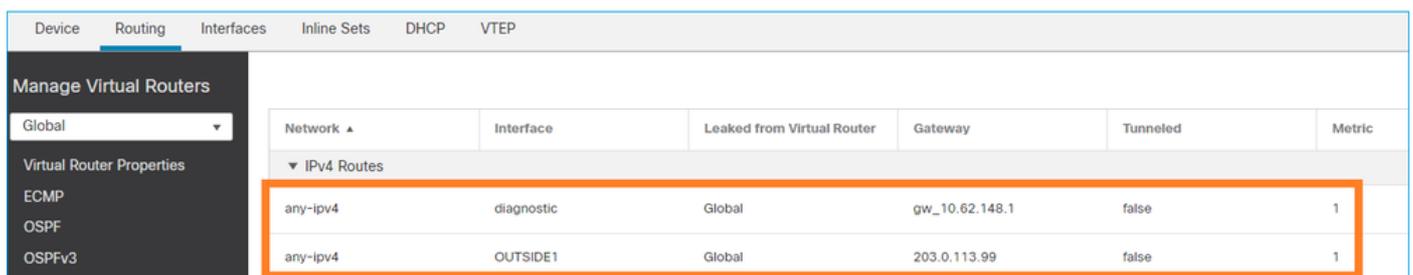

Point principal

Lorsqu'un paquet arrive sur FTD et que l'adresse IP de destination correspond à l'une des adresses IP d'identité, le FTD sait qu'il doit consommer le paquet.

Routage d'interface de diagnostic LINA FTD

FTD (comme un ASA qui exécute le code post-9.5) gère une table de routage de type VRF pour toute interface configurée en tant que gestion seule. L'interface de diagnostic est un exemple d'une telle interface.

Tandis que FMC ne vous permet pas (sans ECMP) de configurer 2 routes par défaut sur 2 interfaces différentes avec la même métrique, vous pouvez configurer 1 route par défaut sur une interface de données FTD et une autre route par défaut sur l'interface de diagnostic :

Network	Interface	Leaked from Virtual Router	Gateway	Tunneled	Metric
any-ipv4	diagnostic	Global	gw_10.62.148.1	false	1
any-ipv4	OUTSIDE1	Global	203.0.113.99	false	1

Le trafic du plan de données utilise la passerelle par défaut de la table globale, tandis que le trafic du plan de gestion utilise la passerelle de diagnostic par défaut :

```
<#root>
```

```
firepower#
```

```
show route management-only
```

Routing Table: mgmt-only

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, V - VPN
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
o - ODR, P - periodic downloaded static route, + - replicated route
SI - Static InterVRF, BI - BGP InterVRF

Gateway of last resort is 10.62.148.1 to network 0.0.0.0

```
S* 0.0.0.0 0.0.0.0 [1/0] via 10.62.148.1, diagnostic
```

La passerelle de la table de routage globale :

```
<#root>
```

```
firepower#
```

```
show route | include S\*|Gateway
```

Gateway of last resort is 203.0.113.99 to network 0.0.0.0

```
S* 0.0.0.0 0.0.0.0 [1/0] via 203.0.113.99, OUTSIDE1
```

Lorsque vous envoyez du trafic à partir du FTD (trafic prêt à l'emploi), l'interface de sortie est sélectionnée en fonction des éléments suivants :

1. Table de routage globale
2. Table de routage de gestion uniquement

Vous pouvez remplacer la sélection de l'interface de sortie si vous spécifiez manuellement l'interface de sortie.

Essayez d'envoyer une requête ping à la passerelle d'interface de diagnostic. Si vous ne spécifiez pas l'interface source, la requête ping échoue car FTD utilise d'abord la table de routage globale qui, dans ce cas, contient une route par défaut. S'il n'y a pas de route dans la table globale, le FTD effectue une recherche de route sur la table de routage de gestion uniquement :

```
<#root>
```

```
firepower#
```

```
ping 10.62.148.1
```

```
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echos to 10.62.148.1, timeout is 2 seconds:  
?????
```

```
Success rate is 0 percent (0/5)  
firepower#
```

```
show capture CAP1 | include 10.62.148.1
```

```
1: 10:31:22.970607 802.1Q vlan#203 P0  
203.0.113.1 > 10.62.148.1 icmp: echo request
```

```
2: 10:31:22.971431 802.1Q vlan#203 P0  
10.1.1.2 > 203.0.113.1 icmp: host 10.62.148.1 unreachable
```

```
<#root>
```

```
firepower#
```

```
ping diagnostic 10.62.148.1
```

```
Type escape sequence to abort.  
Sending 5, 100-byte ICMP Echos to 10.62.148.1, timeout is 2 seconds:  
!!!!!
```

```
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

Il en va de même si vous tentez de copier un fichier à partir de l'interface de ligne de commande LINA à l'aide de la commande copy.

Détection de transfert bidirectionnel (BFD)

La prise en charge BFD a été ajoutée sur la version 9.6 classique d'ASA et seulement pour le protocole BGP : [Routage de détection de transfert bidirectionnel](#)

Sur FTD :

- Les protocoles IPv4 et IPv6 BGP sont pris en charge (logiciel 6.4).
- Les protocoles OSPFv2, OSPFv3 et EIGRP ne sont pas pris en charge.
- BFD pour les routes statiques n'est pas pris en charge.

Routeurs virtuels (VRF)

La prise en charge VRF a été ajoutée à la version 6.6. Pour plus de détails, consultez ce

document : [Exemples de configuration pour les routeurs virtuels](#)
