Verifica di MPLS sugli switch Catalyst 9000

Sommario

Introduzione

Questo documento descrive come configurare e convalidare Multiprotocol Label Switching (MPLS) Layer 3 Virtual Private Network (VPN) sugli switch Catalyst serie 9000.

Prerequisiti

Requisiti

Cisco raccomanda la conoscenza dei seguenti argomenti:

- Inoltro IP
- Border Gateway Protocol (BGP)

- MPLS

Componenti usati

Le informazioni fornite in questo documento si basano sulle seguenti versioni software e hardware:

- C9500 su Cisco IOS® XE 16.12.4
- C9300 su Cisco IOS® XE 16.12.4
- C3850 su Cisco IOS® XE 16.9.6

Le informazioni discusse in questo documento fanno riferimento a dispositivi usati in uno specifico ambiente di emulazione. Su tutti i dispositivi menzionati nel documento la configurazione è stata ripristinata ai valori predefiniti. Se la rete è operativa, valutare attentamente eventuali conseguenze derivanti dall'uso dei comandi.

Premesse

Le VPN MPLS di livello 3 (L3VPN) utilizzano un modello peer-to-peer che utilizza BGP per distribuire le informazioni correlate alla VPN. Una VPN MPLS è costituita da un gruppo di siti interconnessi tramite una rete principale di un provider MPLS. In ogni sede del cliente, uno o più dispositivi CE (Customer Edge) vengono collegati a uno o più dispositivi PE (Provision Edge).

Nel routing convenzionale di layer 3, quando un pacchetto attraversa la rete, ciascuno switch estrae tutte le informazioni rilevanti per inoltrare il pacchetto dall'intestazione di layer 3. Queste informazioni vengono quindi utilizzate come indice per una ricerca nella tabella di routing per determinare l'hop successivo del pacchetto.

Nel caso più comune, l'unico campo pertinente nell'intestazione è il campo dell'indirizzo di destinazione, ma in alcuni casi possono essere rilevanti anche altri campi dell'intestazione. Di conseguenza, l'analisi dell'intestazione deve essere eseguita in modo indipendente su ciascuno switch attraverso cui passa il pacchetto. Inoltre, è necessario eseguire una complessa ricerca nella tabella su ciascuno switch.

In Label Switching, l'analisi dell'intestazione di layer 3 viene eseguita una sola volta. L'intestazione di layer 3 viene quindi mappata in un valore non strutturato a lunghezza fissa denominato **etichetta**.

Molte intestazioni diverse possono essere mappate alla stessa etichetta, purché tali intestazioni producano sempre la stessa scelta dell'hop successivo. In effetti, un'etichetta rappresenta una **classe di equivalenza di inoltro** (FEC) ovvero un insieme di pacchetti che, per quanto diversi, possono essere indistinguibili dalla funzione di inoltro.

La scelta iniziale di un'etichetta non deve necessariamente basarsi esclusivamente sul contenuto dell'intestazione del pacchetto di layer 3; ad esempio, la decisione di inoltrare i pacchetti agli hop successivi può essere basata anche su altri fattori.

Una volta assegnata un'etichetta, viene aggiunta un'intestazione breve all'inizio del pacchetto di layer 3. L'intestazione viene trasportata sulla rete come parte del pacchetto. Agli hop successivi attraverso ciascuno switch MPLS nella rete, le etichette vengono scambiate e le decisioni

vengono prese tramite la ricerca nella tabella di inoltro MPLS dell'etichetta contenuta nell'intestazione del pacchetto. Pertanto, non è necessario rivalutare l'intestazione del pacchetto durante il transito del pacchetto nella rete. Poiché l'etichetta è di lunghezza fissa e non strutturata, il processo di ricerca della tabella di inoltro MPLS è semplice e rapido.

Ogni LSR (Label Switching Router) della rete decide in modo locale e indipendente il valore di etichetta da utilizzare per rappresentare una classe di equivalenza di inoltro. Questa associazione è nota come associazione etichetta. Ogni LSR informa i propri vicini delle associazioni di etichette che ha creato. La conoscenza dei binding di etichette da parte degli switch adiacenti è facilitata dai seguenti protocolli:

- Label Distribution Protocol (LDP): consente ai LSR peer in una rete MPLS di scambiare informazioni sulle etichette per supportare l'inoltro hop-by-hop in una rete MPLS
- Border Gateway Protocol (BGP) - Utilizzato per supportare le reti VPN (Virtual Private Network) MPLS

Quando un pacchetto etichettato viene inviato da LSR A all'LSR B, il valore di etichetta trasportato dal pacchetto IP è il valore di etichetta assegnato dall'LSR B per rappresentare la classe di equivalenza dell'inoltro del pacchetto. Pertanto, il valore dell'etichetta cambia quando il pacchetto IP attraversa la rete.

Modalità d'uso della presente Guida

La guida è suddivisa in due scenari e alla fine del documento viene presentata una sezione di convalida della scala hardware:

- adiacenza single-hop nel core MPLS
- Adiacenze Equal Cost Multi-Path (ECMP) nel core MPLS
- come verificare l'utilizzo di TCAM per i problemi di scalabilità

Ogni scenario riguarda la verifica dei prefissi e delle etichette per ogni dispositivo MPLS.

Terminologia

MPLS	Multi-Protocol Label Switching	Tecnologia di inoltro di pacchetti ad alte prestazioni che integra le prestazio le funzionalità di gestione del traffico dello switching di livello collegamento (livello 2) con la scalabilità, la flessibilità e le prestazioni del routing di livello (livello 3).
PE	Provider Edge (switch/router)	Dispositivo perimetrale della rete del provider che riceve i prefissi IP da un del cliente e li passa nel cloud MPLS.
CE	Customer Edge (switch/router)	Dispositivo presso la sede del cliente collegato al router periferico del provi una rete IP/MPLS di un provider di servizi.
LDP	Label Discovery Protocol	LDP è un protocollo che genera e scambia automaticamente etichette tra r Ogni router genera localmente etichette per i prefissi e quindi annuncia i va delle etichette ai router adiacenti.
LSPA	Matrice percorsi cambio etichetta	Set di etichette per raggiungere una destinazione MPLS specifica. In una ti L3VPN - è possibile avere l'etichetta IGP + VPN. Se c'è un tunnel TE, allora l'etichetta TE + IGP + VPN. Catalyst 9000 può supportare fino a 6 etichette questa serie di etichette è denominata LSPA.
ID stack etichette	ID stack etichette	A indice univoco per identificare uno stack di etichette (unconsente la condivisione LSPA).
Etichetta	Etichetta	Etichetta MPLS utilizzata per la ricerca. Più etichette costituiscono una pila

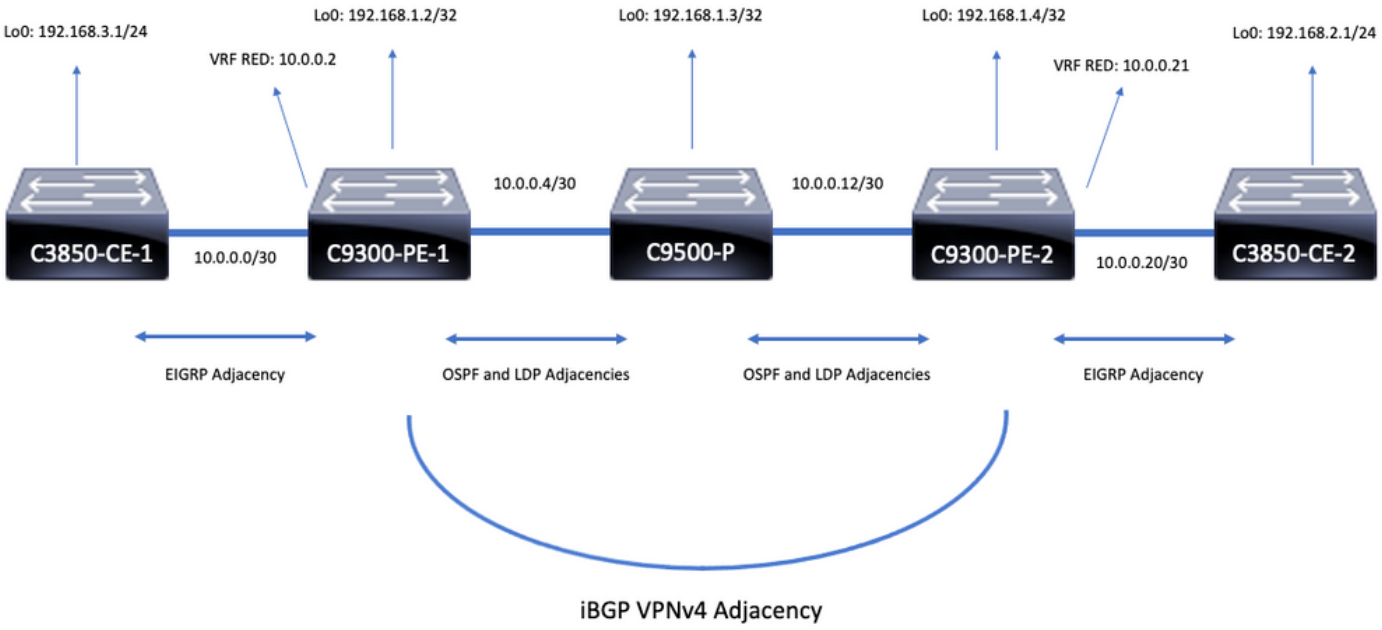
		etichette.
ID prefisso	Identificatore prefisso	Catalyst 9000 crea una risorsa globale per ogni prefisso. In caso di allocazi di etichette per prefisso, esistono tanti ID prefisso quanti sono i percorsi.
EM	Corrispondenza esatta	Voce nella memoria hash corrispondente a uno a uno (percorso host, host connesso direttamente).
LPM	Corrispondenza prefisso più lunga	Qualsiasi route che sia /31 o più breve (le route /32 sono di tipo EM).
TCAM	Memoria ternaria indirizzabile al contenuto	Un tipo di memoria che memorizza ed esegue query su voci con tre input diversi: 0, 1 e X. Questo tipo di memoria deve essere utilizzato nei casi in c possibile che esistano più corrispondenze alla stessa voce e l'hash risultan ciascuna voce non è univoco. **Questa tabella include una maschera o un va "X" che consente di sapere se corrisponde o meno a questa voce.**
CAMMA	Content-Addressable Memory	Termine generale per indicare la memoria hardware (Hash/TCAM).
COSTOLA	Base informazioni di routing	tabella di routing in 'show ip route'
FIB	Base informazioni di inoltro	tabella semplificata con prefissi aggiunti dalle tabelle RIB e ARP con un puntatore alla tabella ADJ
Connessione diretta	Route con connessione diretta	Un prefisso host connesso localmente (ARP adiacente)
Connesso indirettamente	Route con connessione indiretta	Percorso da raggiungere tramite un hop successivo remoto
RETTIFICA	Adiacente (tabella)	archivia le informazioni sull'hop successivo utilizzate per la riscrittura dei pacchetti
EM	Corrispondenza esatta	Host connessi, prefissi host indiretti /32
TCAM	Memoria ternaria indirizzabile al contenuto	Prefissi indiretti /31 o più brevi
FED	Driver motore di inoltro	Livello ASIC (hardware)
FMAN-FP	Forward Manager - Piano di inoltro	FMAN-FP gestisce gli oggetti software che aggiungono, eliminano o modifi le informazioni FED
SI	Indice stazione	Indice stazione = informazioni sulla riscrittura dei pacchetti (RI = Rewrite In e informazioni sull'interfaccia in uscita (DI = Destination Index)
RI	Riscrivi indice	Informazioni di riscrittura dell'indirizzo MAC per l'inoltro di livello 3 all'adiace dell'hop successivo
ID	Indice destinazione	Indice che punta all'interfaccia in uscita

Configurazione e verifica

Scenario 1. L3VPN con adiacenza a hop singolo nel core MPLS

Topologia di riferimento

Ai fini di questo esempio, gli switch Catalyst 9300 funzionano come dispositivi PE, gli switch Catalyst 9500 in Stackwise Virtual come dispositivo P e gli switch Catalyst 3850 come dispositivi CE.



Dettagli configurazione

Verifica di base

Prima della convalida della programmazione MPLS è necessario convalidare alcuni requisiti di base:

- Convalida presenza connettività da PE a PE
- Convalida del percorso con cambio di etichetta (LSP) tra i PE
- Convalida adiacenza BGPv4 tra PE
- Convalida etichette VPNv4 e LDP
- Convalida tabella di inoltro MPLS

Convalida connettività da PE a PE

Èpossibile eseguire il ping tra il loopback del PE remoto e l'origine dal loopback locale, ma questa operazione non conferma che il percorso LSP (Label Switched Path) di MPLS sia valido, poiché gli indirizzi IP di loopback vengono annunciati nell'immagine sottostante.

> Nota: l'adiacenza da PE a MP-BGP VPNv4 viene raggiunta tramite le rispettive interfacce Loopback0.

```
C9300-PE-1#ping 192.168.1.4 source 192.168.1.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.1.4, timeout is 2 seconds:
Packet sent with a source address of 192.168.1.2
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms C9300-PE-1#show ip route
192.168.1.4
Routing entry for 192.168.1.4/32
Known via "ospf 420", distance 110, metric 3, type intra area
Last update from 10.0.0.10 on GigabitEthernet1/0/3, 00:55:58 ago
Routing Descriptor Blocks:
* 10.0.0.6, from 192.168.1.4, 00:55:58 ago, via GigabitEthernet1/0/2
Route metric is 3, traffic share count is 1
```

Convalida provider di servizi di traduzione

Èpossibile utilizzare un traceroute MPLS da PE a PE per convalidare l'LSP e tutte le etichette LDP MPLS lungo il percorso.

> Nota: questo traceroute MPLS impone solo un'etichetta, l'etichetta LDP. Ciò non dimostra che il traffico proveniente dal CE abbia successo, poiché il traffico viene imposto con 2 etichette, l'etichetta VPNv4 (interna) e l'etichetta LDP (esterna).

```
C9300-PE-1#traceroute mpls ipv4 192.168.1.4/32 source 192.168.1.2
Tracing MPLS Label Switched Path to 192.168.1.4/32, timeout is 2 seconds

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
  'L' - labeled output interface, 'B' - unlabeled output interface,
  'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
  'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
  'P' - no rx intf label prot, 'p' - premature termination of LSP,
  'R' - transit router, 'I' - unknown upstream index,
  'l' - Label switched with FEC change, 'd' - see DDMAP for return code,
  'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
  0 10.0.0.5 MRU 1500 [Labels: 17 Exp: 0]
```

```
L 1 10.0.0.6 MRU 1500 [Labels: explicit-null Exp: 0] 8 ms
! 2 10.0.0.14 2 ms
```

Se non si dispone dell'accesso al CE o a un dispositivo dietro il CE e si desidera dimostrare che l'imposizione/disposizione delle etichette VPNv4 e LDP ha esito positivo, è possibile tentare di eseguire il ping dall'interfaccia con interfaccia CE nel VRF su un PE all'altra interfaccia con interfaccia CE nel VRF sul PE remoto.

```
C9300-PE-1#ping vrf RED 10.0.0.21 source 10.0.0.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.0.0.21, timeout is 2 seconds:
Packet sent with a source address of 10.0.0.2
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/2 ms
```

Convalida adiacenza VPNv4 BGP tra PE

```

VPNv4 Label Programming

Nella sezione successiva viene illustrata la programmazione delle etichette VPNv4 sui router MPLS PE, C9300-PE-1 e C9300-PE-2. Poiché C9500 non viene inoltrato sull'etichetta VPNv4, non è presente alcun output da C9500.

C9300-PE-1 VPNv4 Label Programming:

Controllare il prefisso locale del PE, non il prefisso remoto.

```

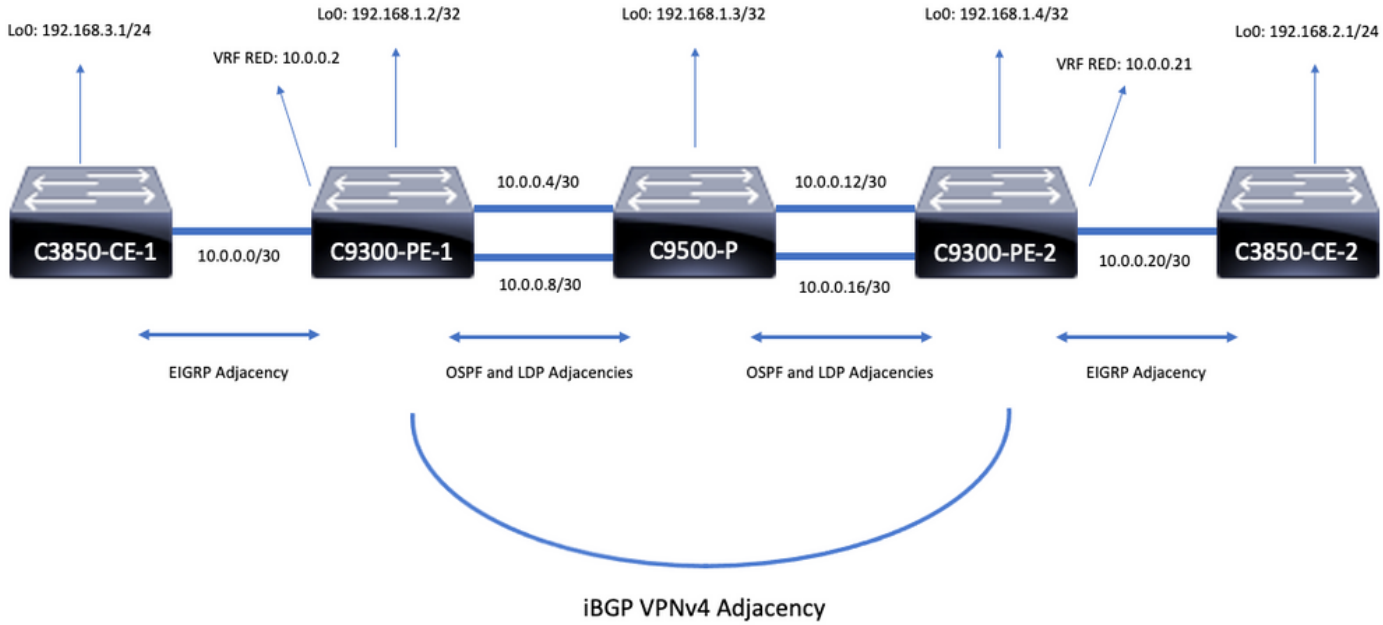
Scenario 2. L3VPN con ECMP tra PE e router IP

Topologia di riferimento

In questo esempio, gli switch Catalyst 3850 funzionano come dispositivi CE, gli switch Catalyst 9300 come dispositivi PE e gli switch Catalyst 9500 in Stackwise Virtual come dispositivi IP. Il protocollo EIGRP viene eseguito tra i dispositivi CE e PE, le adiacenze OSPF e LDP nel core MPLS, con un'adiacenza VPNv4 iBGP tra i dispositivi PE. All'interno del core MPLS, esiste un ECMP tra i dispositivi PE e P.



Dettagli configurazione

```

Convalida di base

Prima della convalida della programmazione MPLS è necessario convalidare alcuni requisiti di base:

- Convalida presenza connettività da PE a PE
- Convalida del percorso con cambio di etichetta (LSP) tra i PE
- Convalida adiacenza BGPv4 tra PE
- Convalida etichette VPNv4 e LDP
- Convalida tabella di inoltro MPLS

Convalida connettività da PE a PE

Èpossibile eseguire il ping tra il loopback del PE remoto e l'origine dal loopback locale, ma questa operazione non conferma che il percorso LSP (Label Switched Path) di MPLS sia valido, poiché gli indirizzi IP di loopback vengono annunciati nell'immagine sottostante.

> **Nota**: l'adiacenza da PE a MP-BGP VPNv4 viene raggiunta tramite le rispettive interfacce Loopback0.

```
C9300-PE-1#ping 192.168.1.4 source 192.168.1.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.1.4, timeout is 2 seconds:
Packet sent with a source address of 192.168.1.2
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms

C9300-PE-1#show ip route 192.168.1.4
Routing entry for 192.168.1.4/32
  Known via "ospf 420", distance 110, metric 3, type intra area
  Last update from 10.0.0.10 on GigabitEthernet1/0/3, 18:39:30 ago
  Routing Descriptor Blocks:
    10.0.0.10, from 192.168.1.4, 18:39:30 ago, via GigabitEthernet1/0/3
      Route metric is 3, traffic share count is 1
```

```
  * 10.0.0.6, from 192.168.1.4, 18:39:30 ago, via GigabitEthernet1/0/2
      Route metric is 3, traffic share count is 1
```

Convalida provider di servizi di traduzione

Èpossibile utilizzare un traceroute MPLS da PE a PE per convalidare l'LSP e tutte le etichette LDP MPLS lungo il percorso.

> **Nota**: questo traceroute MPLS impone solo un'etichetta, l'etichetta LDP. Ciò non dimostra che il traffico proveniente dal CE abbia successo, poiché il traffico viene imposto con 2 etichette, l'etichetta VPNv4 (interna) e l'etichetta LDP (esterna).

```
C9300-PE-1#traceroute mpls ipv4 192.168.1.4/32 source 192.168.1.2
Tracing MPLS Label Switched Path to 192.168.1.4/32, timeout is 2 seconds

Codes: '!' - success, 'Q' - request not sent, '.' - timeout,
  'L' - labeled output interface, 'B' - unlabeled output interface,
  'D' - DS Map mismatch, 'F' - no FEC mapping, 'f' - FEC mismatch,
  'M' - malformed request, 'm' - unsupported tlvs, 'N' - no label entry,
  'P' - no rx intf label prot, 'p' - premature termination of LSP,
  'R' - transit router, 'I' - unknown upstream index,
  'l' - Label switched with FEC change, 'd' - see DDMAP for return code,
  'X' - unknown return code, 'x' - return code 0

Type escape sequence to abort.
  0 10.0.0.5 MRU 1500 [Labels: 17 Exp: 0]
L 1 10.0.0.6 MRU 1500 [Labels: explicit-null Exp: 0] 7 ms
! 2 10.0.0.18 1 ms
```

Se non si dispone dell'accesso al CE o a un dispositivo dietro il CE e si desidera dimostrare che l'imposizione/disposizione delle etichette VPNv4 e LDP ha esito positivo, è possibile tentare di eseguire il ping dall'interfaccia con interfaccia CE nel VRF su un PE all'altra interfaccia con interfaccia CE nel VRF sul PE remoto.

```
C9300-PE-1#ping vrf RED 10.0.0.21 source 10.0.0.2
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 10.0.0.21, timeout is 2 seconds:
Packet sent with a source address of 10.0.0.2
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

Convalida adiacenza VPNv4 BGP tra PE

VPNv4 Label Programming

La sezione successiva tratta della programmazione delle etichette VPNv4 sui router MPLS PE, C9300-PE-1 e C9300-PE-2. C9500=P non esegue l'inoltro sull'etichetta VPNv4, quindi non viene generato alcun output da C9500-P.

C9300-PE-1 VPNv4 Label Programming:

Controllare il prefisso locale del PE, non il prefisso remoto. Controllare l'etichetta da una prospettiva FED, quindi tornare a FMAN RP e FMAN FP.

```
***Software VPNv4 Label Programming***

LDP Label Programming

Nella sezione successiva viene illustrata la programmazione delle etichette LDP sui router MPLS, C9300-PE-1, C9500-P e C9300-PE-2.

L'etichetta LDP (router) è l'etichetta della rete MPLS su cui i pacchetti vengono commutati. Convalidare l'etichetta LDP locale annunciata al PE remoto. Non convalidare l'etichetta LDP remota.

C9300-PE-1 LDP Label Programming:

Convalida l'etichetta LDP locale annunciata al server PE remoto. Non convalidare l'etichetta LDP remota. Controllare l'etichetta da una prospettiva FED e poi tornare indietro a FMAN RP e FMAN FP.

```

Risoluzione dei problemi relativi alla scalabilità hardware

Le informazioni contenute in questa sezione permettono di risolvere i problemi relativi alla configurazione.

Syslog hardware MPLS

Se si esaurisce una determinata risorsa, ad esempio le etichette MPLS, il sistema genera un messaggio SYSLOG.

Punti chiave da ricordare

- MPLS LABEL viene utilizzato per la **disposizione** delle **etichette.** (Questa risorsa viene utilizzata quando i prefissi vengono appresi da un CE locale)
- LSPA viene utilizzato per l'**imposizione di etichette.** (Questa risorsa viene utilizzata quando i prefissi vengono appresi da un PE remoto)

Messaggio di log MPLS	Definizione	Azione di ripristino
%FED_L3_ERRMSG-3-RSRC_ERR: Interruttore 1 R0/0: feed: impossibile allocare la risorsa hardware per la **voce fib a causa dell'esaurimento delle risorse hardware**	Spazio esaurito nell'hardware riservato ai prefissi IP (EM o TCAM)	Eseguire una delle azioni segu per ridurre il numero di prefissi appresi dal **PE locale o remoto** 1. Riepilogare i prefissi a CE 2. Modificare la modalità di allocazione delle etichette da prefisso a vrf
%FED_L3_ERRMSG-3-**mpls_out_of_resource**: Interruttore 1 R0/0: alimentazione: **Risorsa insufficiente per la VOCE LABEL MPLS**. Impossibile programmare l'etichetta locale:8205	**Allocazione etichetta locale:** lo spazio dell'hardware riservato per le etichette locali MPLS è esaurito (EM o TCAM)	Eseguire una delle azioni segu per ridurre il numero di etichett utilizzate in **PE locale:** 1. Riepilogare i prefissi nel CE locale o nel PE locale

(8192/8192) nell'hardware		2. Modificare la modalità di allocazione delle etichette da prefisso a vrf sul PE locale Eseguire una delle azioni segu per ridurre il numero di etichett utilizzate in **PE locale**: 1. Riepilogare i prefissi nel CE locale o nel PE locale 2. Modificare la modalità di allocazione delle etichette da prefisso a vrf sul PE locale
%FED_L3_ERRMSG-3-MPLS_LENTRY_PAUSE: Interruttore 1 R0/0: alimentazione: **Raggiunto limite critico per la** risorsa **MPLS LABEL ENTRY**. **Creazione voce sospesa**.	**Allocazione etichetta locale:** Spazio esaurito (EM o TCAM) nell'hardware riservato alle etichette locali MPLS	
%FED_L3_ERRMSG-3-mpls_out_of_resource: Interruttore 1 R0/0: alimentazione: **Risorse insufficienti per MPLS LSPA**. **Impossibile programmare nell'hardware**	**Allocazione etichetta remota:** Spazio esaurito nell'hardware riservato alle etichette remote LSPA	Eseguire una delle azioni segu per ridurre il numero di etichett utilizzate in **PE remota**: 1. Riepilogare i prefissi nel CE PE remoto 2. Modificare la modalità di allocazione delle etichette da prefisso a vrf sul PE remoto

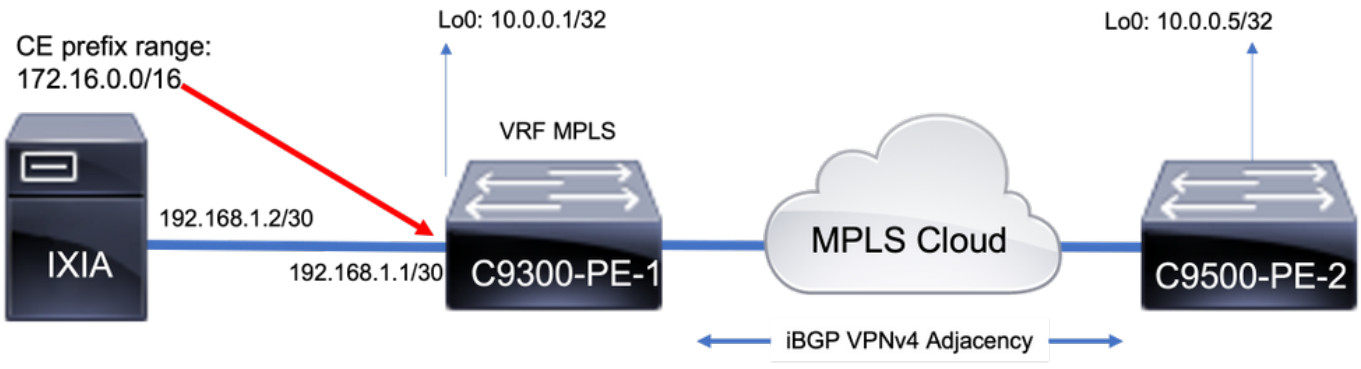
Comandi di convalida hardware

show platform hardware fed active fwd-asic resource tcam utilizationcommand è la prima posizione da prendere in considerazione per valutare se si è verificato un problema di scala hardware. Le informazioni vengono visualizzate per ASIC.

Questa sezione mostra i prefissi di apprendimento PE da BGP in MPLS vrf con i parametri descritti di seguito:

- Viene utilizzata l'allocazione predefinita delle etichette per prefisso
- PE è C9300-48U con Cisco IOS-XE 17.3.4
- CE è Ixia come router adiacente BGP che annuncia i prefissi a un'interfaccia in vrf MPLS
- La lunghezza del prefisso utilizzata è /28. Pertanto, la piattaforma utilizza TCAM per le lunghezze dei prefissi /31 o più brevi
- Questa piattaforma utilizza la memoria EM prima per le etichette MPLS/BGP, quindi esegue il overflow in TCAM se EM diventa pieno

Topologia



Utilizzo risorse previsto

Prima di aggiungere altri prefissi, è possibile utilizzare le seguenti funzioni di base:

- Questa linea di base è stata definita dopo la formazione dei vicini LDP MPLS nella tabella globale
- Da questa base, i prefissi VPNv4 vengono aggiunti in VRF MPLS
- I numeri di riferimento possono variare. Dipende da cosa è già stato programmato sullo switch

Nota: In questo esempio, i prefissi vengono aggiunti da un lato CE-PE, il che si traduce in risorse come LSPA allocate solo sul PE remoto che devono utilizzare uno stack di etichette per la raggiungibilità. Negli scenari reali, la risorsa verrebbe allocata su entrambi i dispositivi PE.

Nota: Per informazioni generali su Catalyst 9000 TCAM o per dettagli su come verificare la presenza di altre funzionalità su TCAM, vedere l'articolo [Informazioni sulle risorse hardware sugli switch Catalyst 9000.]

Nota: ADJ (adiacenze) sono una risorsa condivisa. Per risolvere i problemi con ADJ, vedere l'articolo Informazioni sulle risorse hardware sugli switch Catalyst 9000.

Etichetta MPLS e correzione del limite di scala IPv4

Nella maggior parte dei casi in cui viene utilizzata la funzionalità MPLS e vengono utilizzate troppe risorse hardware, può essere utile modificare l'allocazione delle etichette da (predefinito) per prefisso a per vrf. In questo esempio si consideri l'allocazione delle risorse prima e dopo (**in questo caso, il dispositivo CE-PE è il 9500**).

Nota: L'utilizzo delle risorse in **show platform software fed switch active mpls summary** mostra anche questa riduzione in LABEL o LSPA (a seconda dei casi).

Comandi da raccogliere per TAC

In questa guida vengono descritti i problemi più comuni relativi alle risorse hardware correlati a MPLS, con le procedure di risoluzione appropriate. Tuttavia, nel caso in cui questa guida non risolva il problema, raccogliere l'elenco di comandi visualizzato e allegarlo alla richiesta di servizio.
