Summary: A vulnerability in the Cisco Discovery Protocol (CDP) on Cisco IOS XE Catalyst 4500 series switches allows an attacker to execute arbitrary commands on the target device.

Details

Catalyst 4500 series switches running Cisco IOS XE

with the following configuration:

```
cdp run
```

The vulnerability is caused by a buffer overflow in the CDP protocol.

The attack is performed by sending a specially crafted CDP packet to the target device.

The attacker can execute arbitrary commands on the target device, including the ability to gain root access.

The vulnerability is fixed in Cisco IOS XE Catalyst 4500 series switches version 3.16.0 and later.

For more information, see the Cisco Security Advisory [CSCvk24566](#).
